# ARITHMETICK.

BEING.

A Plain and familiar Method, suitable to the meanest Capacity, for the full Understanding of that incomparable Art, as it is now taught by the ablest School-Masters in CITY and COUNTRY.

By EDWARD COCKER, late Practitioner in the Arts of Writing, Arithmetick, and Engraving: Being that so long since promised to the World.

Perused and published,

By JOHN HAWKINS, Writing-Master near St. George's Church in Southwark, by the Author's correct Copy, and commended to the World by many eminent Mathematicians and Writing-Masters in and near London.

The FIFTIETH EDITION, carefully Corrected and A-mended.

By-GEORGE FISHER, Accomptant. Licensed Sept. 3. 1677. Roger L'Estrange.

#### LONDON:

Printed for A. Bette worth, and C. Hitch, at the Red Book in Paternoffer Fow; R. Ware, at the Bible and Surin Amen-Corners and J. Halger, at the Locking Lord on London Bridge. 1744

TO his much honoured Friends Manwaring Davies, of the Inner-Temple, Eig; and Mr. Humphry Davies of St. Mary Newington Butts, in the County of Surry.

John Hawkins, as an Acknowledgement of unmerited Favours, humbly dedicated this Mannal of Arithmetick.

#### To the READER.

Courteous Reader,

T Having had the Happiness of an intimate Acquaintance with Mr. Cocker in his Life time, often follicited him to remember his Promife to the World, of publishing his Arithmetick; (but for Reasons best known to himself) he refuled it; and after his Death (the Copy falling accidentally into my Hand) I thought it not convenient to fmother a Work of so considerable a Moment, not questioning but it might be as kindly accepted, as if it had been prefented by his own Hand. The Method is familiar and easy, discovering as well the Theorick as the Practick of that necessary Art of Vulgar Arithmetick. And in this new Edition there are many remarkable Alterations for the Benefit of the Teacher or Learner, which I hope will be very acceptable to the World; I have also performed my Promise, in Publishing the Decimal Arithmetick, which finds Encouragement to my Expectation, and the Bookiellers too. I am thine to ferve thee.

John Hawkins.

## Mr. Edward Cocker's

#### PROEME or PREFACE.

BY the secret Instuence of Divine Providence, I have been instrumental to the Benefit of many, by Virtue of those useful Arts. Writing and Engraving: And do now with the same wonted Alacrity, cast this my Arithmetical Mite into the publick Treasury, beseeching the Almighty to grant the like Blessing to these as to my former Labours.

Seven Sciences supremely excellent,

Are the chief Stars in Wisdom's Firmament: Whereof Arithmetick is one, whose Worth The Beams of Profit and Delight shine forth;

This Crowns the rest, this makes Man's Mind complete,

This treats of Numbers, and of this we treat.

I have been often defired by my intimate Friends to publish fomething in this Subject, who, in a pleasing Freedom have signified to me, that they expected it would be extraordinary. How far I have answered their Expectation, I know not; but this I know, That I have designed this Work not extraordinary abstruce or profound; but have by all Means possible within the Circumference of my Capacity, endeavoured to render it extraordinary useful to all those, whose Occasions shall induce them to make use of Numbers. If it be objected, That the Books already published, treating of Numbers, are innumerable; I answer, That's but a small Wonder, fince the Art is infinite. But that there should be fo many excellent Tracts of Practical Arithmetick extant, and so little practised, is to me a great Wonder, knowing that as Merchandize is the Life of the Weal publick, fo Practical Arithmetick is the Soul of Merchandize. Therefore I do ingeniously profess, That in the Beginning of this Undertaking, the numerous Concerns of the bonoured Merchant

#### The Proeme or Preface.

Merchant first possesset my Consideration: And how far I bave accommodated this Composure for his most worthy Service,

let his own profitable Experience be Judge.

Secondly, For your Service most excellent Professors, whose Understandings soar to the Sublimity of the Theory and Practice of this noble Science, was this Arithmetical Tractate composed; which you may please to employ as a Monitor to instruct your young Tyroes, and thereby take Occasion to reserve your precious Moments, which might be exhausted that Way, for your more important Affairs.

Thirdly, For you the ingenious Off-spring of happy Parents, who will willingly pay the full Price of Industry and Exercise for those Arts and choice Accomplishments, which may contribute to the Felicity of your future State: For you, I say, ingenious Practitioners, was this Work composed, which may prove the Pleasure of your Youth, and the Glory of your Age.

Lastly, For you the pretended Numerists of this Vapouring Age, who are more difingeniously witty to propound unnecessary Questions, than ingeniously judicious to resolve such as are neceffary; for you was this Book composed and published, if you will deny your felves so much as not to invert the Streams of your Ingenuity, but by fludiously conferring with the Notes, Names, Orders, Progress, Species, Properties, Proprieties, Proportions, Powers, Affections, and Applications of Numbers delivered berein, become fuch Artists indeed, as you now only seem to be. This Arithmetick ingeniously observed, and diligently tractis'd, will turn to good Accompt to all that should be concerned in Accompts; fince all its Rules are grounded on Verity, and delivered with Sincerity; the Examples built up gradualby from the smallest Consideration to the greatest; and all the Problems or Propositions, well-weighed, pertinent and clear, and not one of them throughout the Tract, taken upon Truft, therefore now,

Zoilus and Momus, lie you down and die, For these Inventions your whole Force defy.

Edward Cocker.

#### Courteous READER,

BEING well acquainted with the deceased Author, and finding him knowing and studious in the Mysteries of Numbers and Algebra, of which he had some choice Manuscrips, and a great Collection of printed Authors in several Languages, I doubt not but he hath writ his Arithmetick suitable to his own Preface, and worthy Acceptation. Which I thought sit to certify, on a Request to that Purpose made, to him that wisheth thy Welfare, and the Progress of Arts.

John Collins.

Novemb. 27, 1677.

This Manual of Arithmetick is recommended to the World by Us whose Names are subscribed, viz.

Mr. John Collins,
Mr. James Atkinfon,

Mat.

Mr. Peter Perkins J. Mr. Rich. Lawrence, Sen.

Mr. Eleazer Wigan,

Mr. Rich. Noble Guilford.

Mr. William Norgate,

Mr. William Mafon,

Mr. Stephen Thomas,

Mr. Peter Storey,

Mr. Benj. Titchbourn,

Mr. Joseph Symmonds,

Mr. Jer. Miles,

Mr. Jofiah Cuffly Mr. John Hawkins.

And generally approved by all Ingenious Artists.

#### CHAP. I.

#### Notation of Numbers.

Rithmetick is the Art of Numbering, or Knowledge which teacheth to Number well. There are diverse Species and Kinds of Arithmetick and Geometry, the which we do intend to treat of in order, applying the Principles of the one to the Definition of the other. For as Greatness is the Subject of Geometry, so Number is the Subject of Arithmetick; and if so, then their first Principles and chief Fundamentals must have like Definitions; or, at least some Congruency.

2. Number is that, by which the Quantity of any Thing is expressed or numbered; as the Unit is the Number by which the Quantity of the Thing is expressed or faid to be one, and two by which it is named two, and half, by which it is named or called half, and the Root of 3, by which it is called the Root of 2; the like of any other.

3. Hence it is that Unit is Number; for the Past is of the same Matter that is his whole, the Unit is Part of the Multitude of Units, therefore the Unit is of the same Matter, that is the Multitude of Units; but the Matter of the Multitude of Units is Number; therefore the Matter of Units is Number; or else, if from a Number given no Number be substracted the Number given remaineth, as suppose 3 the given Number, if as some suppose, 1 be no Number, then if you substract 1 from 3, these must remain 3 still, which is very absurd.

4. Hence it will be convenient to examine from whence Number hath its Rife or Beginning. Most Authors maintain, that Unit is the Beginning of Number, and itself no Number; but looking upon the Principles and Definitions in the first Rudiments of Geometry, we shall find that the

Definition of a Point is in no Way congruous with the Definition of an Unit in Arithmetick; and therefore One or Unit must be in the Bounds or Limits of Number, and confequently the Beginning of Number is not to be found in the Number 1; wherefore making Number and Magnitude congruent in Principles, and like in Definitions, we make and constitute a Cypher to be the Beginning of Number, or rather the Medium between increasing and decreasing Numbers, commonly called absolute or whole Numbers, and negative and fractional Numbers, between which nothing can be imagin'd more agreeable to the Definition of a Point in Geometry; for as a Point is an Adjunct of a Line, and itself no Line, so is (o) Cypher an Adjunct of Number, and itself no Number: And as a Point in Geometry cannot be divided or increased into Parts; so likewise (o) cannot be divided or increased into Parts; for as many Points, tho' in Number infinite, do make no Line, fo many (o) Cyphers, tho' in Number infinite, do make no Number. For the Line

A B cannot be increased by the Addition of the Point C, neither the Number D be increased by the Addition of the (0) Cypher E; for if you add nothing to 6, the Sum will be 6, (0) Cypher neither increasing nor diminishing the Number; but if it be granted that A B be extended or prolonged to the Point C, so that A C be made a continued Line, then A B is increased by the Addition of the Point C. In like Manner, if we grant D (3) be prolonged to E (0) so that D E (60) be a continued Number,

making 60, then 6 is augmented by the

A C
D
6
E
0
Sum
6
A—B—C
D E|60

60

Aid of (0) as conflictuting the Number (60) Sixty; and furthermore that 1 or Unit is material, and a Number, at d that (0) is the Beginning of Number is proved by all Authors, although directly; for the Tables of Sines and Tangents prove one Degree to be a Number, because the Sine of 1 Degree is 174524, (the Radius being 10000000) and the Beginning of the Table is (0) and it answereth e0000, &c.

and

ar d

Au-

and

e the

ereth

Hence

5. Hence it is that Number is not Quantity discontinued for that which is but one Quantity, is not Quality difjunet: (60) Sixty, as it is a Number, is one Quantity, viz one Number (60) Sixty; therefore as it is a Number, it is not Quantity disjunct, for Number is some such Thing in Magnitude, as Humidity in Water: for as Humidity extends itself through all and every Part of Water, fo Number related to Magnitude, doth extend itself through all and every Part of Magnitude. Also, as continued Water doth answer a continued Humidity, to to a continued Magnitude doth answer a continued Number. As the continued Humidity of an intire Water, fuffereth the same Division and Distinction that his Water doth; so the continued Number suffereth the same Division and Distinction that his Magnitude doth. And thus much concerning the Definition and Principles of Number and Magnitude. We come now to trest of,

6. The Characters or Notes by which Numbers are fignified, or by which a Number is ordinarily expressed; and they are these, viz. (c) Cypher or nothing, 1 One, 2 Two, 3 Three, 4 Four, 5 Five, 6 Six, 7 Seven, 8 Eight, 9 Nine. The Cypher, which though of itself it expressed not any certain or known Quantity, yet is the Beginning or Root of Number, and the other 9 Figures

are called fignificand Figures or Digi's.

7. In Number of any Sort, two Things are to be con-

fidered, viz Notation and Numeration.

8. Notation teacheth how to describe any Number by certain Notes and Characters, and to declare the Value thereof, being so described, that is by Degrees and Periods.

9. A Degree confilts of three Figures, viz. Of three Places, comprehending Units, Tens, and Hundreds, fo 365 is a Degree, and the first Figure (5) on the right Hand, stands simply for his own Value, being Units, or so many Ones, viz. Five; the second in Order from the Right, signifies as many Times Ten as there are Units contained in it, viz Sixty; the third in the same Order signifies so many Hundreds as it contains Units, so will the Expression of the Number be Three hundred sixty sive, &c.

10. A Period is when a Number confitts of more than 3 Figures, or Places, and whose proper Order is to prick

B 2

P

C

al

ca

w

25

br

every third Place beginning at the right Hand, and so on to the Left; so the Number 63452 being given, ir will be distinguished thus, 63,452 and expressed thus; Sixty three thousand, sour hundred sist two, likewise 4578,236,782, being distinguished as you see, will be expressed thus, Four thousand, sive hundred seventy eight Millions, two hundred thirty six thousand, seven hundred eighty wo.

11. Number is either absclute or Negative.

that by which annexing another Figure or Cypher, it becomes ten times as much a it flood for before; and if two Figures or Cyphers be annexed, it makes an hundred times as much as it flood for before, &c. As if you annex to the Figure 6 a Cypher, then it will be (600) Sixty, fo if two Cyphers are annexed, then it will be (600) Six hundred, and if you annex to it (4) Four, then it will be (64) Sixty four: and if you annex (78 Seventy eight, it will

be then (678) Six hur dred feventy eight, &c.

12. A Negative, or broken, fractional decreafing Number, is that by which prefixing a Point or Prick roward the left Hand, its Value has decreafed from fo many Units, to fo many tenth Parts of any Thing; and if a Point and (:) Cypher or Digit, be prefixed, it will be then fo many hund ed Parts; and if a Point and two Cyphers or Digits be prefixed, its Value is decreased to be to many thoufand Parts; as if you would prefix before the Figure 3 a Point () or Prick thus (3) it is then decreased from 3 Units or 3 Integers, to three tenth Parts of an Unit or an Inreger: And if you refix a Point and Cypher thus (.03) it is decreased from three Integers to 3 hundsed Parts of an Integer; and by this Means 5 1. absolute, by prefixing of a Point, will be decreased to .5 1. negative, which is 5 tenth Parts of a Pound, equal in Value to 10 Shillings, and fo by prefixing of more Cyphers or Digin, its Value is decreated in a decuple Proportion ad infinitum. As in the following Scheme, or rather Order of Numbers, we have placed (c) Cypher in its due Place and Order, as it is in the Beginning and Medium of Number; for going from (c) towards the left Hand, you deal with intire, absolute, whole, increasing Numbers. In

1	ncrea	ing N	umber	s.				1	Decre	afing 1	Numbe	TS.
29 mm	876 mmm	543 mmm mmm CX	256 nmm	2	X	and the same of the	X	C	nmm	mmm mgrar X	979 mmm mmm XC	m m

But going from (5) the Place of Units towards the right Mand, you meet with broken, negative, fractional, and decreasing Numbers. And hence it follows, that Multiplication increases the Product in absolute Numbers, but decreases the Product in negative Numbers. Also Division decreases the Quorient in whole Numbers, and increases it in negative fractional Numbers.

An absolute, intire, whole, increasing Number, hath always a Point prefixed towards the right Hand; and there-

fore.

d,

-

u-

3

n-

31

In-

nth

l fo de-

the

ave

s in

ute,

15. A negative, broken, decimal, decreafing Number, hath always a Point prefixed towards the left Hand. When we express Integers or whole Numbers, as 5 Pounds, 5 Feet, 26 Men, we usually annex a Point or Prick after the Num-

1. feet, men inch.

ber thus,

5. 5. 26. 347.

But when we express Decimals, or Numbers that are denied to be intire, or decreasing Numbers, we do commonly presix a Point or Prick before the said Decimal or decreasing Number thu (.3) that is three Tenths, or 3 Primes (.03) that is 3 Hundredth, or 3 Seconds.

16. A whole or absolute Number is an Unit, or a composed Multitude of Units, and it is either a Prime, or else a

compound Number.

17: Prime Numbers amongst themselves, are those which have no Multitude of Units for a common Measure, as 8 and 7, or 10 and 13, because not any Multitude of Units can equally measure or divide them without a Remainder.

18. Compound Numbers amongst themselves, are those which have a Multitude of Units for a common Measure, as 9 and 12, because three Measures them exactly, and ab-

breviates them to three and four.

B 3

10. A

19. A broken Number, commonly called a Fraction, is a Part or Parts of a whole Number, viz. A Part of an Integer, as 3 one Third, is one third Part of an Unit.

20. A broken Number or Fraction, confifts of 2 Parts,

viz. the Numerator and Denominator.

are set one over the other, with a Line between them; and the Numerator is set above the Line, and expresseth

the Parts therein contained.

22. The Denominator of a Fraction, is the inferior Number placed below the Line, and expresset the Number of Parts, into which the Unit or Integer is divided, as let \(^2\) be the Fraction given, so shall \(^3\) be the Numerator, and doth express or number the Multitude of Parts contained in this Fraction, for \(^4\) is a Fraction compounded of Fourths or Quarters, and the Figure \(^3\) in numbering shews us, that in that Fraction there are \(^3\) of the \(^4\) th Parts of Quarters; also in the same Fraction \(^4\) is the Denominator, and both express the Quality of the Fraction, viz. that the Whole or Integer is divided into \(^4\) equal Parts.

23. A broken Number is either proper or improper; viz. proper when the Numerator is less than the Denominator, for \( \frac{3}{4} \) is a perfect projer Fraction; but an improper Fraction hath its Numerator greater, or at least equal to the Denominator, thus \( \frac{1}{3} \) is an improper Fraction, the

Reason is in giving in the Definition.

24. A proper broken Number, is either Simple or Compound, viz. Simple when it hath one Denominator, and Compound when it confitteth of divers Denominators; if \(\frac{1}{4}\tau^2\frac{1}{20}\) were given, we say, they are each of them Single or Simple Fractions, because they consist but of one Numerator, and one Denominator: but if \(\frac{2}{4}\) of \(\frac{1}{2}\) of \(

25. When a fingle broken Number or Fraction hath for its Denominator a Number confifting of an Unit in the first Place towards the left Hand, and nothing but Cyphers from the Unit towards the right Hand, it is then the more

te

21

in

W

fu

aptly and rightly called a decimal Fraction; under this Head are all our decreasing Numbers placed, and in our 13th Definition, called Negatives; and by the order there prescribed, we order them to be Decimals, by signing a Prick or Point before the Numerator, rejecting the Denominator: Therefore according to our last Rule,  $\frac{1}{10000}$ , are Decimals. A Decimal Fraction may be expressed without its Denominator (as before) by presixing a Point or Prick before the Numerator of the said Fraction, and then shall the former Fractions  $\frac{1}{10000}$  and  $\frac{2}{100000}$  stand

thus, .5, and .025.

.

r

S

e

y

But oftentimes, as in the fecond and fourth Fractions and 120, a Prick or Point will not do without the Help of a Cypher or Cyphers prefixed before the fignificant Figures of the Numerator, and therefore when the Numerator of a decimal Fraction confifteth not of fo many Places as the Denominator hath Cyphers, fill up the void Places of the Numerator with prefixing Cyphers before the fignificant Figures of the Numerator, and then fign for a Decimal, fo shall 100 be .005. 100 will be .025 and 100 will be .0072. Now by this we may easily discover the Demominator having the Numerator; for always the Denominator of any decimal Fraction confists of so many Cyphers, as the Numerator hath Places, with an Unit prefixed before the said Cypher, viz. under the Point or Prick.

26. A decimal Number or Fraction, is expressed by Primes, Seconds, Thirds, Fourths, &c. and is a Number decreasing. Here instead of natural and common Fractions, as 1 of a Thing, we order the Thing or Integer into Primes, Seconds, Thirds, Fourths, Fifths, &c. that our

Expression may be consonant to our former Order.

27. In decimal Arithmetick, we always imagine that all intire Units, Integers, and Things, are divided first into ten equal Parts, and these Parts so divided we call Primes; and Secondly, we divide also each of the former Primes, into other ten equal Parts, and every one of these Divisions we call Seconds; and Thirdly, we divide each of the said Seconds into ten other equal Parts, and those so divided, we call Thirds; and so by decimating the former, and subdecimating these latter, we run on ad infinitum.

B 4

28. Let a Pound Sterling, Troy-weight, Averdupoisweight, Liquid merfare. Dry-meafure, Long meafure, Time, Dozin, or any other Thing or Integer be given to be decimally divided in this Notion promited, we ought to let the first Division be Primes, the next Division Seconds. the next Thirds. &c. So one Pound Sterling being 20 Shillings, when divided into ten equal Parts, the Value of each Part will be 2 Shillings, therefore one Prime of a Pound Sterling will stand thus, (.1) which is in Value 2 Shillings; 2 Primes will stand thus, (.3) and that is in Value 6 Shillings. Again, a Prime or . 1 being divided into ten equal Parts, each of those Parts will be one Second, and is thus expressed (o1) and its Value will be found 2d. Farthing, and 10 of a Farthing; and to will .of fignify one Shilling or five Seconds. And if .or be divided into ten other equal Pars, each of those Parts so divided will be Thi ds. and will thand thus, our, and its Value will be found to be 96 of a parthing, or 26 of a Farthing, and .000 Thirds will be 2 d and .64 of a Farthing, or 164 of a Fart ing. &c. So that 375 will be found to reprefen 7 s 6 d. for the three Primes are 6 Shillings, and the 7 Seconds are I s. 4 d and 15 of a Penny, and the 5 Thirds are Penny, 12 of a Penny, both which added together make 7 1 6 d.

20. If you put any Bulk or Body, representing an Integer if it be decimally divided, then the Parts in the first Decimation are Primes, the next Seconds, and the next Decimation is Thirds, the next Fourths, &c. As let there be given a Bullet of Lead, or fuch like, whose Weight let it be 50%. Troy, this is called an Unit, Integer, or Thing; then will the like Weight and Matter make 10 other, the which together will be equal to 50 % and will weigh each of them 51. a piece; take of the same Matter, and equal to 51 make to more, then each of those weigh 6 Ounces a piece; also, if again, you take 6 Ounces and thereof make 10 other small Bullets, each of them will weigh 2 Penny weights Troy; and thus have you made Primes, Seconds, and Thirds, in Respect of the Integer, containing 50 l. Troy weight; fo that 5 Primes are equal to the half Mass, and 2 Primes, and 5 Second, are a Quarter of the Mais, and therefore one of the first Division,

2 of the second Division, and 5 of the third Division, will be equal in Weight to half a Quarter of the Mass, and

contains 61 2 Ounces.

30. When a decimal Fraction followeth a whole Number, you are to separate or part the Decimal fr m the whole Number by a Point or Prick; so if .75 followed the whole Number 32, set them thus, 32.75. You shall find that diverse Authors have diverse Ways in expressing mixe

Numbers, as thus, 32/75, or 32/175 or 32/75, but you will find that 32.75 thus placed and expressed, are the

fittelt for Calculation-

31. A mixt Number hath two Parts, the whole and the broken; the whole is that which is composed of Integers, and the broken is a Fraction annexed thereunto. So the mixt Number, 36 18 being given, we say, that 36 is the whole Number, which is composed of Integers; and the 18 is the broken Number annexed, which sheweth that one of the former Integers (of that 36) being divided into 12 Parts, 18 doth express 8 of those 12 Parts more, belonging to the said 36 Integers.

32. Denominative Numbers are of one, or of many; and those are of diverse Sorts and Kinds, viz. Singular called Unit, as 1; and Plural a Multitude, as 2, 3, 4, 5; Single, of one Kind only called Digits, as, 1, 2, 3, 4, 5, 6, 7, 8, 9; and Compound of many; 10, 11, 12, &c. 102,

367. 6°c.

Proportionable, as Single, Multiple, Double, Triple, Quadruple, &c Denominate, as Pounds, Shillings, Pence; Undenominate, as 1, 2, 3, &c. Perfect, as 6, 28, 496, 8123, 130816, 2096128, &c. whose Parts are equal to the Numbers; imperfect, unequal, and more than the Sum, as 12, to 1, 2, 3, 4. 6. Numbers Commensurable, as 9, 12, because 3 measures them both; but 16 and 17 are incommensurable because no one common Number or Measure can menture them; Lineal in form of a Line, as .... Superficial, in form of a Superficies or Plane, as :::::
or: ; &c. and Number cubical or folid, in Form of a

Cube. Those two latter are otherwise called Figurative Numbers: there are also other Numbers called Tabular, as Sines, Tangents, Secants, &c. Others that be called Logarithmetick, or borrow'd Numbers, fitted to Proportion for Ease, and speedy Calculation of all Manner of Questions.

#### CHAP. II.

Of the Natural Division of Integers, and the several Denominations of the Parts.

1. A ND that we may advance methodically herein, we will begin with the main Pillars on which Arithmemetick is founded, viz. the feveral Species of that Art: But first,

Of Money, Weights, &c.

2 The least Denomination or Fraction of Money used in England is a Farthing, from which is produced the sollowing Table, called the Table of Coin, &c.

The first of these Tables, viz. that on the Lest Hand, is plain and easy to be understood, and therefore wants no Direction. In the second Table above the Line, you have 1 l. 20 s. 12 d. 4 grs. whereby is meant, that a Pound is equal to 20 Shillings, and 1 Shilling is equal to 12 Pence, and 1 Penny equal to 4 Farthings; under the Line is 1 l. 20 s. 240 d. 360 grs. which signifies 1 l. to contain 20 Shillings, or 240 Pence, or 960 Farthings; in the second Line below that is 1 s. 12 d. 48 grs. the first standing under the Denomination of Shillings, whereby it is to be noted, that 1 Shilling is equal to 12 Pence or 48 Farthings; and likewise that below that, one Penny is equal in Value to four Farthings; understand the like Reason in the following Tables of Weight, Measure, Time, Motion, and Dozens.

Of Troy Weight.

3. The leaft Fraction or Denomination of Weight ufed in England, is a Grain of Wheat gathered out of the Middle of the Ear, and well dried; from whence are produced thefe following Tables of Weight, called Troy Weight.

Grains of Wheat
Artificial Grains
Penny-weights
Ounces

2 Quarts 2 Pottles Se Fint r Quart r Pottle r Gallon

Gallons

And note, that the Yard, as also the Ell, is usually divided into Quarters, and each Quarter into 4 Nails.

Note alfo, That a Geometrical Pace is 5 Feet, and there

are 1056 fuch paces in an English Mile.

9. The Parts of the superficial Measures of Land are such as are mentioned in the following Table, viz.

A Table of Land Measure.

40 Square Poles or Perches

4 Roods

A Table of Land Measure.

I Rood, or Quarter, of an Acre

A Roods

By the foregoing Table of Land Measure, you are informed what a Pole or Perch is, and by this, that 40 square Perches is a Rood. Now a square Perch is a Superficies very aptly resembled by a square Trencher, every Side thereof being a Perch of 5 Yords and a Half in Length, 40 of them is a Rood, and 4 Roods an Acre. So that a Superficies, that is 40 Perches long, and 4 Broad, is an Acre of Land, the Acre containing in all 160 square Perches.

10. The leaft denominative Part of Time, is one Minute, the greatest Integer being a Year, from whence is pro-

duced this.

000086

Table of Time.

Hours, 49 Minutes, 4 Seconds, and 21 Thirds.

#### CHAP. III.

### Of the Species or Kinds of Arithmetick.

THER E are several Species of this Art; and which may be termed either Natural, Artificial, Analytical, Algebraical, Lineal, or Instrumental: But what we are now to treat upon, relates to the single Parts of Natural Arithmetick, so far as concerns Numeration; of which there are also four Kinds, viz. Addition, Substraction, Multiplication, and Division.

#### CAAP. IV.

#### Addition of whole Numbers.

A Ddition is the Reduction of two or more Numbers, of like Kind, together into one Sum or Total: Or, it is that by which diverse Numbers are added together, to the End that the Sum or Total Value of them all may be discovered.

The first Number in every Addition is called the Addible Number or Numbers added, and the Number invented by the Addition, is called the Aggregate, or Sum, contain-

ing the Value of the Addition.

The Collation of the Numbers, is the right placing the Numbers given respectively to each Denomination, and the Operation is the Artificial adding of the Numbers given together, in order to the finding out of the Aggregate or Sum.

2. In Addition place the Numbers given respectively the one above the other, in such fort, that the like Degree, Place, or Denomination, may stand in the same Series, viz. Units under Units, Tens under Tens, Hundreds under Hundreds, &c. Pounds under Pounds, Shillings under

3352

213

133

3698

under Shillings, Pence under Pence, &c. Yards under

Yards, Feet under Feet, &c.

3. Having thus placed the Numbers given (as before) and drawn a Line under them, add them together, beginning with the leffer Denomination, viz. at the right Hand; and fo on, subscribing the Sum under the Line

respectively; As for Enxample,

Let there be given 3352, 213, and 133, to be added together: I fet the Units in each particular Number under each other, and fo likewise the Tens under the Tens, &c.

and draw a Line under them, as in the Margin; then I begin at the Place of Units, and add them together upwards, faying 2 and 2 are 6, and 2 make 8, which I fet under the Line, and under the same Figures added together; then I proceed to the next Place, being the Place of Tens, and add them in the same Mannet as I did in the

Place of Units, faying 3 and 1 are 4, and 5 are 9, which I likewise set under the Line respectively; then I go to the Place of Hundreds, and add them up as I did the other. fayig, 1 and 2 are 3, and 3 are 6, which is also fet under the Line; and laftly, I go to the Place of Thoufands, and becaue there is no other Figure to add to the 2. I fer it under the Line in its respective Place, and so the Work is finished; and I find the Sum of the a given

Numbers to be 2608.

e c - 1. y - e s

4. But if the S.m of the Figures of any Series exceedeth Ten, or any Number of Tens, fubscribe under the same the Excess above the Tens, and for every Ten carry one, to be added to the next Series towards the left Hand, and so go on till you have finished your Addition; always remembring, that how great toever the Sum of the rigures of the last Series is, it must all be set down under the Line respectively. So 3678 being given to be added to 2357, I fet them down as is before directed, and as you

fee in the Margin, with a Line drawn under them. then I begin and add them together, faying 7 and 8 are 15, which is 5 above 10, wherefore I fet 5 under the Line, and carry I for the 10 to be added to the next Series, faying, I that I carried and 5 is 6, and 7 are 13, wherefore I fet down 3,

6035

3678

9 it

r

and carry 1 (for the Ten) to the next Series; then I say, 1 that I carried and 3 are 4, and 6 are 10, now, because it comes to just 10, and no more, I set ounder the Line, and carry 1 from the 10 to the next, and say, 1 that I carried and 2 are 3, and 3 are 6, which I set down in its respective Place; thus the Addition is found to be 6035. Several Examples of this Kind follow.

Numbers to 38074 be added 8437 923 76

Sum 92856

5. If the Numbers given to be added, are contained under divers Denominations, as of Pounds, Shillings, Pence, and Farthings; or of Tuns, Hundreds, Quarters, Pounds, &c. Then in this Case, having disposed of the Numbers of each Denomination under other of the like Kind; beginning at the least Denomination (minding how many of one Denomination do make an Integer in the next) and having added them up, for every Integer of the next greater Denomination that you find therein contained, bear an Unitin Mind to be added to the faid next greater Denomination, expressing the Excess respectively under the Line; proceed in this Manner until your Addition be finished; the following Example will make the Rule plain to the Learner. Thus these following Sums being given to be added, viz. 1361. 13 s. 4 d. 2 grs. and 79 1. 07 s. 10 d. 3 gr. and 33 l. 18 s. 09 d. 1 grs. alfo 15 l. 09 s. of d. o grs. The Number being disposed according to Order, will stand as in the Margin of the next Page. Then I begin at the Denomination of Farthings, and add them e it

33-18-09-1
15-09-05-0

265-09-05-2

confider that 20 Pence are 2 Shillings and 5 Pence, therefore I fet down 5 Pence in Order under the Line, and keep 2 in Mi nd for the 2 Shillings to be added to the Shillings. Then I go on, faying, 2 that I carried and 9 are 11, and 18 are 29, and 7 are 36, and 13 are 49; then I confider that 49 Shillings are 2 Pounds and 9 Shillings, wherefore I fee the 9 Shillings under the Line, and carry the 2 for the 2 Pounds to the next and latt Denomination of Pounds; and proceed, faying, 2 that I carried and 5 make 7, and gare 10, and g are 19, and 6 are 25; then I fet down 5, and carry 2 for the 2 Tens; and proceed, faying, 2 that I carry and I are 3, and 3 are 6, and 7 are 13, and 3 make 16, and I fet down 6, and carry I for the 10, and go on, faying, I that I carried and I are 2, which I fet in its Place under the Line, and the Work is finished: and thus I find the Sum of the aforesaid Numbers to be 265 1. 0 s. 5 d. 2 grs. Here is another Example in the Operation, of which the Learner must have an Eye to the Table of Troy-Weight. The Numbers given are 381. 7 ox. 13 p. w. 18. gr. and 50 l. 10 oz. 10 p. w. 12 gr. and 42 l. 08 oz. 05 p. w. 16 gr. And in order to the Addition thereof, I place them as you fee, and proceed to the Operation faying, 16 and 12 are 28, and 18 are 46; now because 24 Grains make 1 Penny-weight, 46

Grains are 1 Penny-weight, and 22 1. 02. p. w. gr. Grains, therefore I fet down 22, and 38-07-13-18 carry 1 for the Penny-weight, and 50-10-12-15 make 6, and 10 are 16, and 13 42-08-05-16 are 29, which is one Ounce and 0 Penny-weights. I fet down 9 in 132-02-09-22

its Place under the Line, and car-

ry 1 to the Ounces, faying, 1 that I carry and 8

are 9; and 10 are 19, and 7 are 26, and because 26 Ounces make 2 Pounds 2 Ounce. I fet down 2 for the Ounces, and carry 2 to the Pounds; going on, 2 hat I carry and 2 are 4, and 8 make 12, that is 2 and go 1; then 1 I carry and 4 are 5, and 5 are 10, and 3 are 13, which I fet down as in the Margin, and the Work is finished, and I find the Sum of the said Numbers to amount to 132 lb. 2 oz. 9 p. w. 22 gr. The Way of proving these, or any Sum in this Rule, is shewed immediately after the entuing Example.

	The Proof of	Addition

6. Addition is proved after this Manner: when you have found out the Sum of the Number given, then separate the uppermost Line from the rest, with a Stroke or Dash of the Pen, and then add them all up again as you did before, leaving out the uppermost Line; and having so done, add the new invented Sum to the uppermost Line you separated, and if the Sum of those two Lines be equal to the Sum sirst found out, then the Work is performed true, otherwise not. As for Example: Let us prove the first Example of Addition of Money, whose Sum we find to be 265 l. 9 s. 5 d. 2 grs. and which we prove thus:

Having separated the uppermost Number from the rest by a Line, as you see in the Margin, then I add the same together again, leaving out the said uppermost Line, and the Sum thereof I set under the first Sum or true Sum; which doth amount to 128 1. 16 s. or d. o qrs. then again I add the new Sum to the uppermost Line that before was separated from the rest, and the Sum of those two is 26g i. og s. of d. 2 qrs. the same with the first Sum, and therefore I conclude that the Operation was rightly performed.

Quest.

Quest. 1. There was an old Man, whose Age was required, to which he replied, I have 7 Sons having two Years between the Birth of each other, and in the 44th Year of my Age my eldest Son was born, which is now the Age of the youngest. I demand, What was the old Man's Age.

Now to resolve this Question, first set down the Father's Age at the Birth of his first Child, which was 44; then the Difference between the Oldest and the Youngest, which is 12 Years, and then the Age of the Youngest, which is 44; and then add them altogether and their Sum is 100, the complete Age of their Father.

Quest. 2. A Man lent his Friend at several Times, these several Sums, viz. at one Time 63 l. at another Time 50 l. at another Time 48 l. at another Time 156 l. Now I defire to know how much was lent him in all?

Set the Sums lent one under another, as you see in the Margin, and then add them together, and you will find their Sum to amount to 317 L. which is the Total of all the several Sums lent, and so much is due to the Creditor.

317 Queft. 3. There are two Numbers, the least whereot is 40, and their Difference 14. I defire to know what is the greater Number, and also what is 40 the Sum of them both? First set down the 14 least, viz. 40 and 14, the Difference, and add them together, and their Sum is 54 for the greates 54 greatest Number, then I set 40 (the least) under least 40 54 (the greatest) and add them together, and their Sum is 94, equal to the greatest and least Sum 94 Numbers.

CHAP.

#### CHAP. V.

#### Of Substraction whole Numbers.

Substraction is taking of a leffer Number out of a greater or a like Kind, whereby to find out a Third Number, being or declaring the Inequality, Excess, or Difference between the Numbers given; or Substraction is that by which one Number is taken out of another Number given, to the End that the Residue or Remainder may be known, which Remainder is also called the Rest, Remainder, or Difference of the Numbers given,

2. The Number out of which Substraction is to be made must be greater, or at least equal with the other Number given; the higher Number is called the Major, and the lower Minor; and the Operation of Substraction being finished, the Rest or Remainder is called the Difference of

the Number given.

3. In Substraction, place the Numbers given respectively, the one under the other, in such Sort as like Degrees, Places, or Denominations may stand in the same Series, wiz. Units under Units, Tens under Tens, Pounds under Pounds, &c. Feet under Feet, and Parts under Parts, &c. This being done, draw a Line underneath, as in Addition.

4. Having placed the Numbers given as is before directed, and drawn a Line under them, substract the lower Number (which in this Case must always be less than the Uppermost) out of the higher Number, and subscribe the Difference or Remainder respectively below the Line, and when the Work is finished, the Number below the Line will give you the Remainder.

As for Example, Let 364521 be given to be substracted from 795836, I set the lesser under the greater as in the

Margin, and draw a Line under the greater a Margin, and draw a Line under them, then beginning at the right Hand, I fay, 1 out of 6 and there remains 5, which I fet in order under the Line; then I proceed to the next, faying, 2 from 3 refts 1, which I note also under the Line; and thus I go on till I have finished the

Work

795836

304521

431315

Work; and then I find the Remainder or Difference to be

431315.

1315

Work

5. But if it so happen (as commonly it doth) that the lowermost Number or Figures is greater than the uppermost, then in this Case add ten to the uppermost Number, and substract the said lowermost Number from their Sum, and the Remainder place under the Line, and when you go to the next Figure below, pay an Unit, by adding it thereto for the ten you borrowed before, and substract that from the higher Number of Figures, and thus go on till your Substraction be sinished. As for Example, Let 437503 be given, from whence it is required to substract 153827, I dispose of the Numbers as is before directed, and as you see in the Margin; then I begin, saying, 7 from 3 I cannot, but (adding 10 thereto) I say 7 from 13 and there remains 6, which I set under the Line in order;

then I proceed to the next Figure faying, 1 that 437503 I borr-wed and 2 is 3 from 0 I cannot, but 3 153827 from 10 and there remains 7, which I likewife fet down as before; then 1 that I borrowed and 8 is 9, 283676

from 5 I cannot, but 9 from 15 and there remains

6; then 1 borrowed and 3 is 4 from 7, and there remains 3; then 5 from 3 I cannot, but 5 from 13 and there remain 8; then 1 borrowed and 1 are 2, from 4, and there rest 2; and thus the Work is finished: After these Numbers are substracted one from another, the Inequality, Remainder, Excess, or Difference, is found to be 283676. Examples for thy farther Experience may be these that follow.

From 3469916 Take 738642 From 361577 Take 5864

turn

Rest 2731274

6. If the Sum or Number to be substracted is of several Denominations, place the lesser Sum below the greater, and in the same Rank and Order, as is shewed in Addition of the same Numbers; then begin at the right Hand, and take the lower Number out of the uppermost, if it be lesser; but if it be bigger than the uppermost, then borrow an Unit from the next greater Denomination, and

turn it into the Parts of the less Denomination, and add those Parts to the Uppermost, noting the Remainder below the Line; then proceed and pay one to the next Denomination for that which you borrowed before, and proceed in this Order till the Work be finished. An Example of this Rule followeth: Let 375 1. 13 s. 7 d. 1 qr. be given, from whence let it be required to substract 57 1. 16 s. 03 d. 2 qr. In order whereunto, I place the Numbers as you see in the Margin; and thus I begin at the least Denomination, saying, 2 from 1 I cannot, therefore I borrow

one Penny from the next Denomination, and turn it into Farthings, which is 4, and adding 4 to 1, which is 5, I fay, but 2 frem 5, and there remain 3, which I put under the Line, then going on, I fay, 1 that I borrow'd and 3 is 4 from 7, and there rests 3; then

375 13 07 1 57 16 03 2

I.

317 17 03 3

going on, I say, 16 from 13 I cannot, but borrowing 1 Pound, and turning it into 20 Shillings, I add to it 13, and that is (33) wherefore I say, 16 from 33 and there remains 17, which I set under the Line, and go on; saying, 1 that I borrow'd and 7 is 8, from 5 I cannot, but 8 from 15, and there remains 7; and the 1 that I borrowed and 5 is 6, from 7 there rests 1, and 0 from 3 rest 3, and the Work is done. And I find the Remainder or Difference to be 217 1. 171. 03 d. 3 grs.

Another Example of Troy-weight, may be this, I would substract 17 1. 10 02. 11 p. w. 20 gr. from 24 1.

Numbers according to the Rule, and begin, faying 20 from 8 I cannot, but I borrow 1 Penny weight, which is 24 Grains, and add them to 8, and there are 32, wherefore I fay 20 from 32 rest 12, then 1 that I borrowed

1. 62 p. w. gr. 24 05 00 03 17 10 11 20

c6 c6 o8 12

and It is 12, from 00 I cannor, but 12 from 20 (borrowing an Ounce, which is 20 Penny weight) and there remain 8, then I that I borrowed and 10 is 11, from 5 I cannor, but 11 from 17, and there rest 6; then I that I borrowed, and 7 is 8, from 4 I cannot, but 8 from 14 and

and there rests 6; then I that I borrowed and I is 2, from 2, and there rests nothing; so that I find the Remainder

or Difference to be 6 1 6 oz. 8 p. w. 12 gr.

7. It many times happeneth that you have many Sums or Numbers to be substracted from one Number; as suppose a Man should lend his Friend a certain Sum of Money, and his Friend hath paid him part of his Debt at severel Times, then before you can conveniently know what is still owing, you are to add the several Numbers or Sums of Payment together, and substract their Sum from the whole Debt, and the Remainder is the Sum due to the Creditor; as suppose A lendeth to B 564 l. 16 s. 10 d. and B hath retaid him 56 l. 15 s. 8 d.

repaid him 76 l. 15 s. 8 d. at one Time, 163 l. 18 s. 11 d. at another Time, and 241 l. 15 s. 8 d. at another Time; and you would know how the Accompt standeth between them, or what is more due to A. In order whereunto I first fet down the Sum which A lent, and draw a line underneath it,

then under that Line I fet

Lent 564 15 OI 16 80 Paid at 76 163 feveral 18 payments. 03 15 C241 485 Paid in all 05 II Remain 05

the feveral Sums of Payment, as you fee in the Margin; and having brought the feveral Sums of Payment into one Total by the 5th Rule of the fourth Chapter foregoing, I find their Sum amounteth to 485 l. 11 s. 3 d. which I fublitract from the Sum first lent by A, by the 6th Rule of this Chapter, and I find the Remainder to be 76 l. 5 s. 7d. and so much is still owing to A.

When the Learner hath good Knowledge of what hath been already delivered in this and the foregoing Chapters, he will with Ease understand the Manner of working the

following Examples.

The Proof of Substraction.

8. When your Substraction is ended, if you defire to prove the Work, whether it be true or no; then add the Remainder to the minor Number, and if the Aggregate or these two be equal to the major Number, then is your Operation true, otherwise false: Thus let us prove the first Example of the fifth Rule of this Chapter; where after Substraction is ended, the Numbers stand as in the Margin,

C 3

12

16

17

13

375

57

317

375

07.

03

03

07

Now to prove the Work, I add the faid Remainder 283676 to the Minor Number 153827 by the fourth Rule of the foregoing Chapter, and I find the Sum or Aggregate to be 437503, equal to the major Number, or Number from whence the leffer is substracted. Behold the Work in the Margin.

The Proof of another Example may be the first of the 6th Rule of this Chapter, where it is required to substract 57 l. 16 s. 3 d. 2 qrs. from 375 l. 13 s. 7 d. 1 qr. and by the Rule I find the Remainder to be 317 l. 17 s. 03 d.

3 qrs. Now to prove it I add the faid Remainder 317 l. 17 s. 03 d. 3 qrs. to the minor Number 57 l. 16 s. 03 d. 2 qrs. and their Sum is 375 l. 13 s. 7 d. 1 qr. equal to the major Number, which proves the Work to be true; but if it had hap pened either to have been more or less than the said major Number, then the Operation had been false.

9. The general Effect of Subfraction, is to find the Difference or Excess between two Numbers, and the Rest when a Payment is made in Part of a greater Sum, the Date of Books printed, the Age of any Thing, by knowing the present Year, and the Year wherein they are made,

created, or built, and fuch like.

The Questions appropriated to the Rule, are such as follow.

Quelt. What Difference is there between one Thing of

125 Feet long, and another of 66 Feet long?

To resolve this Question, First I set down the major or greater Number 125, and under it the minor or lesser Number 66, as is directed in the third Rule of this Chapter, and according to the sourth Rule of the same, I substract the Minor from the Major, and the Remainder, Excess, or Difference I find tobe So. See the Work in the Margin.

Queft. 2. A Gentleman owed a Merchant 365 1. where-

of he hath paid 278 1. what more doth he owe?

re-

To

O

To give an Answer to this Question, I first set down the Major Number 365 L and under it I place 365 278 the minor, and substract the one from the other, whereby I discover the Excess, Difference, or Remainder, to be 87; and so much is still due to the Creditor, as per Margin.

Quest. 3. An Obligation was written, a Book printed, a Child born, a Church built, or any other Thing made

in the Year of our Lord 1572, and now we account the Year of our Lord 1741, the Question is to know the Age of the said things; that is, How many Years are passed since the said Things were made? I say, if you substract the lesser Number 1572 from the greater 1741, the Remainder will be 169, and so many Years are passed since the

Making of the faid Things; as by the Work in the Margin.

Quest. 4. There are three Towns lie in a strait Line, viz London, Hantingdon, and York, now the Distance between the farthest of these Towns, viz. London and York, is 151 Miles, and from London to Huntingdon is 49 Miles I demand how far it is from Hantingdon to York?

To resolve this Question, substract 49 the Distance between London and Huntingdon, from 151, the Distance between London and York, and the Remainder is 102, for the true Distance between Huntingdon and York. See the Work in the Margin.

### CHAP. VI.

# Of Multiplication of whole Numbers.

Multiplication is performed by two Numbers of like Kind, for the Production of a Third, which shall have such Reason to the one, as the other hath to the Unit, and in Effect is a most brief and artiscial Compound Addition, of many equal Numbers of the like kind into one Sum. Or, Multiplication is that by which we multiply two or more Numbers, the one into the other, to the End that their Product may come forth, or be discovered.

C 4

32

Or, Multiplication is the Increasing of any one Number by any other, so often as there are Units in that Number, by which the other is increased; or by having two Numbers given to find a Third, which shall contain one of the Numbers as many times as there are Units in the other.

2. Multiplication hath three Parts. First, the Multiplicand, or Number to be multiplied. Secondly, the Multiplier, or Number given by which the Multiplicand is to be multiplied. And thirdly, the Product or Number produced by the other two, the one being

multiplied by the other; as if 8 were given to be multiplied by 4, I fay 4 times 8 is 32; here 8 is the Multiplicand, and 4 is the Multiplier, and 32 is the Product.

3. Multiplication is either Single, by one Figure ; or

Compound, that confifteth of many.

Single Multiplication is faid to confift of one Figure, because the Multiplicand and Multiplier confists each of them of a Digit, and no more; fo that the greatest Product that can arile by Single Multiplication is 81, being the Square of of and Compound Multiplication is faid to confift of many Figures, because the Multiplicand or Multiplier confift of more Places than one; as if I were to Multiply 436 by 6: It is called Compound, because the Multiplicand 436 is of more Places than one, viz. 3 Places.

4. The Learner ought to have all the Varieties of Single Multiplication by Heart, before he can well proceed any farther into this Art, it being of most excellent Ule, and none of the following Rules in Arithmetick, but what have a principal Dependance thereupon, which may be learnt by the

Mul iplication TABLE.

T	2	3	4	5	6	17	8	9
2	4	6	8	01	12	14	16	18
3	6	9	12	15	18	21	24	27
4	8	12	16	20	24	28	32	36
5	10	15	20	25	30	1 35	40	45
6	12	18	24	30	136	42	48	54
7	14	21	28	135	42	149	56	63
8	16	24	32	40	48	156	64	72
9	18	27	36	145	154	163	72	18:

The Use of the preceeding Table is this: In the uppermost Line or Column, you have expressed all the Digts from 1 to 9; and like wife beginning at 1, and going downwards in the fide Column, you have the fame; so that if you would know the Product of any two fingle Numbers multiplied by one another, look for one of them (which you please) in the uppermost Column, and for the other in the fide Column, and running your Eye from each Figure along the respective Columns in the common Angle (or Place) where these two Columns meet, there is the Product required. As for Example, I would know how much 8 times 7; First I look for 8 in the uppermost Column, and 7 in the fide Column; then do I cast my Eye from & along the Column downwards from the same, and likewise from 7 in the fide Column, I cast my Eye from thence toward the right Hand, and find it to meet with the first Column at 56, so that I conclude 56 to be the Product required, Gc.

5. In Compound Multiplication, if the Multiplicand confists of many Places, and the Multiplier of but one Figure; first fet down the Multiplicand, and under it place the Multiplier in the Place of Units, and draw a Line underneath them, begin then, and multiply the Multiplier into every particular Figure of the Multiplicand, beginning at the Place of Units, and so proceed towards the Left Fland, setting each particular Product under the Line, in order as you pacceed; but if any of the Products ex-

C

ceed

ceed to, or any Number of Tens, fet down the Excefs, and for every 10 carry an Unit to be added to the next Product, always remembring to fet down the total Product of the last Figure; which Work being finished, the Sum or Number placed under the Line shall be the true and total Product required. As for Example, I would multiply 478 by 6: First set down 478, and underneath it 6, in the Place of Units, and draw a Line underneath them, as in the Margin; then I begin, faying, 6 times 8 is 48, which is I above 4 Tens, therefore I fet down 8 (the Excess) and bear 4 in Mind for the 4 Tens; then I proceed, faying, 6 times 7 is 42 and 4 that I carry'd is 46, I then fet down 6 and carry 4, and go on, faying, 6 times 4 is 24, and 4 that I carried is 28 and because it is the last Figure, I set it all down and fo the Work is finished, and the Product is found

to be 2868, as was required.

6. When in Compound Multiplication, the Multiplier, confisteth of diverse Places, then begin with the Figure in the Place of Units in the Multiplier, and multiply it into all the Figures of the Multiplicand, placing the Product below the Line, as was directed in the last Example; then begin with the Figure of the second Place of the Multiplier, viz. The Place of Tens, and multiply it likewife into the whole Multiplicand (as you did the first Figure) placing its Product under the Product of the first Figure; do in the same Manner by the Third, Fourth, and Fisth, &c. until you have multiplied all the Figures of the Multiplier particularly into the whole Multiplicand, still placing the product of each particular Figure under the product of its preceding figure; herein observing the following Caution.

In the placing of the Product of each par-A Caution . ticular figure of the Multiplier, you are not to follow the 2d Rule of the 4th Chapter, viz. to place Units under Units, and Tens under Tens, &c. but to place the figure or Cypher into the place of Units of the fecond Line under the fecond figure or place of Tens in the Line above it, and the figure or Cypher in the place of Units in the third Line under the place of Tens in the fecond Line, &c. observing this Order till

you have finished the Work, still placing the Figure of every Line or Product under the second Figure or Place of Tens in that which was above it, and having so done, draw a Line under all these particular Products, and add them together; so shall the Sum of these Products be the total

Product required.

As if it were required to multiply 764 by 27, I fet them down the one under the other, with a Line drawn underneath them; then I begin, faying 7 times 4 is 28, then I fet down 8 and carry 2; then I fay, 7 times 6 is 42, and 2 that I carried is 44, that is 4 and go 764, then 7 times 7 is 49, and 4 that I carry is 27

53, which I fet down, because I have not another Figure to multiply; thus I have done with the 7, then I begin with the 2, saying, 2 times 4 is 8, which I set down under (4) the second Figure or Place of Tens in the Line above it, as you 20628

may fee in the Margin; then I proceed, faying,

2 times 6 is 12 that is 2 and carry 1; then 2 times 7 is 14, and 1 that I carry is 15, which I fet down, because it is the Product of the last Figure; so the Product of 764 by 7 is 5348, and by 2 is 1528, which being placed the one under the other, as before directed, as you see in the Margin, and a Line drawn under them, and they added together respectively, make 20628, the true Product required, being equal to 27 times 764.

Another Example may be this; Let i be required to multiply 5486 by 465. Id ip is of the Multiplicand and

Multiplier according to the Rule, and begin multiplying the first Figure of the Multiplier, which is (5) into the whole Multiplicand, and find the Product is 27430; then I proceed; and multiply the second Figure (6) of the Multiplier into the Multiplicand, and find the Product to amount to 32916, which is subscribed under the other Product respectively; then do I multiply the third and last Figure (4) of the Multiplier into the Multiplicand, and the Product is 21944, which is likewise

placed under the fecond Line respectively; then I draw a Line under the said Product being places the one under

5486 465

27430 32916 21944

2550990

the other according to Rule) and add them together, and the Sum is 2550990, the true Product fought, being equal to 5486 times 465, or 465 times 5486.

More Examples in thi 430865 4739	s Rule are these following 6400758 37496
3877785	38404548 57605822
3016055	25603032
1723460	44202274
2041869235	19202274
	240002821068

Compendium in Multiplication.

7. Although the former Rules are sufficient for all Cases in Multiplication, yet because in the Work of Multiplication many times great Labour may be saved, I shall acquiant the Learner with some Compendiums in order thereunto, viz. If the Multiplicand or Multiplier, or both of them end with Cyphers then in your multiplying you may neglect

beat ad dextram circulos, omissis circulis stat ipsorum numerorum multiplicatio, & facto demum tot insuper integrorum loci accenseantur quot sunt omissi circuli in utroque factore. Clavis Mat. c. 4. 3.

Si numeris prepositis u-

nus vel uterque adjunctos ha-

multiplying you may neglect the Cyphers, and multiply only the fignificant Figures, an to the Product of those fignificant Figures, add so many Cyphers as the Numbers

given to be multiplied did end with; that is, annex them on the right Hand of the faid Product, fo shall that give you the true Product required. As if I were to multiply 32000 by 4300, I fet them down in order to be multiplied, as you see in the Margin; but neglecting the Cyphers in both Numbers, I only multiply 32 by 43, and the Product I find to be 1376, to which I an-

next the 5 Cyphers in the Multiplicand and Multiplier,

and then it makes 137600000 for the true Product of

32000 by 4300.

8. If in the Multiplier, Cyphers are placed between fignificant Figures, then multiply only the fignitrue placing of the first Fi- De Arithm.

Si intermedio multiplificant Figures, neglecting the cantis loco circulus fuerit, Cyphers; but here special ille negligitur. Alsted. c. 6.

gure after the Neglect of fuch Cypher or Cyphers; and therefore you must observe in what Place of the Multiplier the Figure you multiply by standeth, and fet the first

Figure of that Product under the same Place of the Product of the fame Figure of your Multiplier: As for Example, Let it be required to multiply 371568 by 40007. First I multiply the Multiplicand by 7, and the Product is 2600976, then neglecting the Cyphers I multiply by 4, and that Product is 1486272; now Iconfider, that 4 it the 5th Figure in the

Multiplier, therefore I place 2 (the first Figure of the Product by 4) under the 5th Place of the first Product by 7, and the rest in order, and having added them together, the Total Product is found to be 14865320976.

Other Examples in this Rale, are these following.

327586 7864371 6030 20604 31457484 9827580 1965516. 47186226. 15728742. 1975343589

162037500084

9. If you are to multiply any Number by an Unit with Cyphers, as by 10, 109, 1000, &c. then annex so many Cyphers before the Multiplicand, and that Number when the Cyphers are annexed, is the Product required. As if you would multiply 428 by 100, annex 2 Cyphers to 428, and it is 42800. If it were required to multiply 102, by 1000000,

10000, annex 4 Cyphers, and it gives 1020000 for the Product required.

The Proof of Multiplication.

Truth, all other Ways are false (according to Frisius) and therefore it will be necessary in the first Place to learn Livision, and by that to prove Multiplication. There are some other Ways used indeed, but on a strict Examen, there is not one in a Thousand of their Products right; therefore I omis them.

11. The general Effect of Multiplication is contained in the Definition of the fame, which is to find out a third Number, so often containing one of the two given Numbers,

as the other containeth Units.

The fecond Effect is, by having the Length and Breath of any Thing (as a Parallelogram or long Plain) to find the superficial Content of the same, and by having the superficial Content of the Base, and the Length, to find out the Solidity of any Parallelopipedon, Cylinder, or other solid Figures.

The third Effect is, by the Contents, Price, Value, Buying. Selling, Expence, Wages, Exchange, Simple Interest, Gain or Lofs of any one Thing, be it Money, Merchandize, &c. to find out the Value, Price, Expence, Buying, Selling Exchange, or Interest of any Number of

Things of the like Name, Nature, and Kind.

The fourth Effect (is not much unlike the other) by the Contents, Value, or Price of any one Part of any Thing denominated, to find the Contents, Value, or Price of the whole Thing, all the Parts into which the whole is divided, multiplying the Price of one of those Parts.

The fifth Effect is, to aid, to compound, and to make other Rules, as chiefly, the Rule of Proportion, called the Golden Rule or Rule of Three; also by it, Things of one

Denomination are reduced to another.

If you multiply any Number of Integers, to the Price of the Integer, the Product will discover the Price of the

Quantity, or Number of Integers given.

In a Rectangular Solid, it you multiply the Breadth of the Base by the Depth, and that Product by the Length the last Product will discover the Solidity or Content of the same Solid. Some Questions proper to this Rule, may be these following; Quest. 1. What is the Content of a square Piece of Ground, whose Length is 28 Perches, and Breadth 13?

Answer. 364 square Perches; for multiplying 28 the

Length by 13 the Breadth, the Product is fo much.

Quest. 2. There is a square Battle whose Flank is 47 Men, and the Files 19 Deep, what Number of Men doth that Battle contain? Facit. 893; for multiplying 47 by 19, the Product is 893.

Quest. 3. If any one Thing cost 4 Shillings, what shall 9 Things cost? Answ. 36 Shillings, for multiplying 4 by

9, the Product is 36.

e

e

of

e

of

h

ne

20

Quest. 4. If a Piece of Money or Merchandize be worth or cost 17 Shillings, what shall 19 such Pieces of Money or Merchandize cost? Facit. 323 Shillings, which is equal to 161. 35.

Quest. 5. If a Soldier or Servant get or spend 14 s per Month, what is the Wages or Charges of 49 Soldiers or Servants for the same Time? Multiply 49 by 14, the Pro-

duct is 686 s. or 34 l. 6 s. for the Aniwer.

Quest. 6. If in a Day there are 24 Hours, how many Hours are there in a Year, accounting 365 Days to conftitute the Year? Facit. 8760 Hours, to which if you add the 6 Hours over, and above 365 Days as there is in a Year, then it will be 8766 Hours; now if you multiply this 8766 by 60, the Number of Minutes in an Hour, it will produce 525760, the Number of Minutes in a Year.

#### CHAP. VII.

## Division of whole Numbers.

Division, is the separating or parting of any Number or Quantity given, into any part assigned or to find now often one Number is contained in another; or from any two Numbers given, to find a third that shall consist of so many Units, as the one of those two Numbers given is comprehended to contain in the other.

2. Division hath 3 parts or Numbers remarkable, viz. First, the Dividend; 2dly, The Divisor; 3dly
The

The Quotient. The Dividend is the Number given to be parted or divided. The Divifor is the Number given, by which the Dividend is divided, or it is the Number which fleweth how many Parts the Dividend is to be diveded into. And the Quotient is the Number produced by the Divifion of the two given Numbers the one by the other.

So 12 being given to be divided by 3, or into three equal Parts, the Quotient will be 4; for 3 is contained in 12 four times, where 12 in the Dividend, and 2 is the Divifor,

and 4 is the Quotient.

3. In Division set down your Dividend, and draw a crooked Line at each End of it, and before the Line at the left Hand place the Divisor, and behind that on the right Hand place the Figures of the Quotient, as in the Margin, where it is repuired to divide 12 3) 12 (4 by 3; First, I set down 12 the Dividend, and on each Side of it, I draw a crooked Line, and before that on the left Hand do I place 3 the Divisor; then do I seek how often 3 is contained in 12, and because I find

it four times, I put 4 behind the crooked Line, on the right Hand of the Dividend, denoting the Quotient.

4. But if, when the Divisor is a fingle Figure, the Dividend confifteth of two or more Places, then having placed them for the Work (as before directed) put a Point under the first Figure of the left Hand of the Dividend, provided it be bigger than (or equal to) the Divisor, but if it be leffer than the Divisor, then put a Point under the fecond Figure from the left Hand of the Dividend; which Figures, as far as the Point goeth from the left Hand, are to be recokoned by themselves, as if they had no Dependance upon the other Part of the Dividend: And for Distinction fake may be called the Dividuai; then ask how often the Divifor is contained in the Dividual; placing the Answer in the Quotient; then multiply the Divisor by the Figure that you placed in the Quotient, and fet the Product thereof under your Dividual, then draw a Line under the Product, and substract the said Product from the Dividual, placing the Remainder under the faid Line then put a. Point under the next Figure in the Dividend, on the right Hand of that to which you put the Point before, and

ce

on

he

rer

are

re-

ro-

ial,

ght

and

raw

a

draw it down, placing it on the right Hand of the Remainder which you found by Substraction; which Remainder with the faid Figure annexed before it, shall be a new Dividual; then fee again how often the Divifor is contained in this new Dividual, and put the Answer in the Quotient on the right Hand of the Figure which you put there before; then multiply the Divisor by the last Figure that you put in the Quotient, and subscribe the Product under the Dividual, and make Substraction, and to the Remainder draw down the next Figure from the grand Dividend (having first put a Point under it) and put it on the Right Hand of the Remainder for a new Dividual as before, and proceed thus till the Work is finished.

Observing this general Rule in all Kinds of Division. First, to seek how often the Divisor is contained in the Dividual; then (having put the Answer in the Quotient) multiply the Divisor thereby, and substract the Product from the Dividual. An Example or two will make the Rule plain. Let it be required to divide 2184 by 6. I dispose of the Numbers given as is before directed, and a

you fee in the Margin; in order to the

Work, then because 6 the Divisor is more 6) 2184 (3

than 2 the first Figure of Dividend, I put a Point under 1 the fecond Figure,

which makes the 21 for the Dividual, then do I alk how often 6 the Divisor is contained in 21, and because I can-

not have it more than 3 times, I put 3 in the Quotient, and thereby do I multiply the Divisor (6) and the Product is 18, which I fet in order under the Dividual, and fubstract it therefrom, and the Remainder (3) I place in order under the Line as you fee in the Margin.

Then do I make a Point under the next Figure of the Dividend, being 8 and draw it down, placing it before the Remainder 3, so have I 36 for a new Dividual, then do I feek how often 6 is contained in 38, and because I can't have it more than 6 times, I put 6 in the Quotient, and thereby do I multiply the Divisor 6, and the

6) 2184 (3

Product (36) I put under the Dividual (38) and substract it therefrom, and the Remainder 2 I put under the Line, as

you fee in the Margin.

Then I do put a Point under the next (and last) Figure of the Dividend (being 4) and draw it down to the Remrinder 2, and putting it on the Right Hand thereof, it maketh 24 for a new Dividual; then I ask how often 6 is contained in 24, and 6) 2184 (364 the Answer is 4, which I put in the Quotient, and multiply the Divisor (6) thereby, 18 and the Product (24) I put under the 38 Dividual (24) and substaact it therefrom, and the Remainder is (o); and thus the 36 Work is finished, and I find the Quotient to be 364, that is 6 contained in 2184. 24 just 364 times, or 2184 being divided into 24 6 equal Parts, 364 is one of those Parts. (c)

Again, If it were required to divide 2646 by 7, or into 7 equal Parts, the Quotient will be found to be 378, as by the following Operation appeareth.

7) 20	546	(37	8
	21		
	54 49		
	5		
	00	,	

So if it be required to divide 946 by 8, the Quotient will be found to be 118, and 2 remaining after Division is ended. The Work followeth:

n-

25

will end8) 946 (118

		• •	1
	8		
-	100		
	14	1	
	. 8	,	
		-	
	6	5	
	6.	4	
		-	
	(2	)	

Many Times the Dividend cannot exactly be divided by the Divisor, but something will remain, as in the last Example, where 946 was given to be divided by 8, the Quotient was 118, and there remained 2 after the Division was ended: Now what is to be done in this Case with the Remainder, the Learner shall be taught when we come to treat of the Reducing (or Reduction) of Fractions.

And here note, That if after your division is ended, any Thing do remain, it must be lefter than your divisor;

for otherwise your Work is not rightly performed.

Other Examples are such as follows.

8) 73464 (9183 9) 13758 (1528

72	9
14 8	47 45
66 64	45
24 24	78 72
<b></b>	10

5. But if the divisor consisteth of more Places than one, then chuse so many Figures from the lest Side of the dividend for a dividual as there are Figures in the divisor, and put a Point under the farthest Figure of that dividual

1

to the right Hand and seek how often the first Figure on the lest Side or the Divisor is contained in the first Figure on the lest Side of the Dividual, and place the Answer in the Quotient, and thereby multiply your Divisor, placing your Product under your Dividual, and substract it therefrom, placing the Remainder below the Line; then put a Point under the next Figure in the Dividend, and draw it down to the said Remainder, and annex it on the right Side thereof, which makes a new Dividual, and proceed as before, till the Work is sinished.

And if it so happen, that after you have chosen your first Dividual (as it is before directed) you find it to be lesser than the Divisor, then put a Point under the Figure more near to the right Hand, and seek how often the first Figure on the less Side of the Divisor is contained in the two first Figures on the less of the Dividual, and place the Answer in the Quotient, by which multiply the Divisor, and place the Product thereof in order under the Dividual, and substract it

therefrom, and proceed as before.

Always remembring that in all Cases of Division, if after you have multiplied your Divisor by the Figure first placed in the Quotient, the Pr duct be greater than the Dividual, then you must cancel that Figure in the Quotient and instead thereof put a Figure lesser by an Unit (.r One) be greater than the Dividual, make the Figure in the Quotient yet lesser by an Unit, and thus do until your Product be lesser than the Dividual, or at the most equal thereto, and then make Substraction. &c.

So if you would divide 9464 by 24, the Quotient will be found to be 394. I first our down the given Number as is before directed in the 31 Rule. Now because my Di-

visor consisterh of two Figures, I therefore put a Point under the second Figure from the lest Hand of my Dividend,
which there is 4, wherefore I seek how
often 2 the first Figure (on the lest
Side of the Divisor) is contained in 9
(the like first in the Dividual) the Answer
is 4, which I put in the Quotient, and
thereby multiply all the Divisor, ane find
the Product to be 96, which is greater

24)	9464 (	39

than the Dividual 94, wherefore I cancel the 4 in the Quotient, and inftead therefore I put three (an Unit leffer) and by it multiply the Dividor 24, and the Product is 72, which I substract from 94 the Dividual, and the Remainder is 22; then do I make a Point under the next Figure 6 in

the Dividend, and draw it down, and place it on the right Side of the Remainder 22, and it makes 226 for a new Dividual; now because the Dividual 226 confishesh of a Figure more than the Divisor, therefore I teek how often 2 (the 1st Figure of the Divisor) is contained in 22, the two first of the Dividual, and I say 9 time, wherefore I put in the Quotient, and thereby multiply the Divisor

tient, and thereby multiply the Divisor 24, the Product (216) I place under the Dividual 226, and substract it

from it, and there remaineth 10.

Then I go on and make a Point under the next and last Figure (3) in the Dividend, and draw it down to the Remainder 10, and it makes [104 for a new Dividual, it is also a Figure more than the Divisor; and therefore I see how often 2 is contained in 10, I answer 5 times; but multiplying my Divisor by 5, the Product is 120, which is greater than the Dividual, and therefore I make it but 4, and by it multiply the Divisor, and the Product is 96, which being placed under, and substracted from the Dividual, there remaineth 8; and thus the whole Work of this Division is ended, and I find that 9464 being divided by 14, or into 24 equal Parts, is found to be 394, as was before; and the Remainder is 8, as you see in the Work following.

24) 9464 (394

			18	

Another

Another Example may be this: Let there be required the Quotient of 1183654 divided by 385: First, I dispose

of the Numbers in order to their dividing, and because 118, the three first Figures of the Dividend, are lesser than the Divisor 385, I therefore make a Point under the fourth Figure which is 3, and see how often 3 (the first Figure of the

385) 1183653 (3

1155

Divisor) is contained in 11: The Answer is 3, which I put in the Quotient, and therefore multiply the Divisor 385, and the Product is 1155, which I substract from the Dividual 1183, and there remains 28. Then (as before) I draw

down the next Figure, which is 6, and place it before the Remainder 28; fo have I 268 for a new Dividual, and becave it hath no more Figures than the Divifor, I feek how often 3 (the First Figure of the Divifor) is contained in 2 (the first

385) 1183653 (30

286

e

0

a

th

R

all;

Figure of the Dividual) and the Answer is 0; for a greater Number cannot be contained in a leffer; wherefore I put 0 in the Quotient, and thereby (according to the 5th Rule) I should multiply the Divisor; but if I do, the Product will be 0, and 0 substracted from the Dividual 286, the Remainder is the same; wherefore I draw down the next supre (c) from the Di-

the next figure (5) from the Dividend, and put it before the said Remainder 286, so have I 2865 for a new Dividual; and because it consisteth of 4 places, viz. a place more than the Divitor, I seek how often 3, the 1st figure of the Divisor is contained in 28, the two first of the Dividual, and I say there is 9 times 3 is 27; but mul-

2865 2865 2695

tiplying my whole Divisor (385) thereby, I find the product to be 3465, which is greater than the dividual 2165; wherefore I chuse 8, which is lesser by an Unit than 9, and thereby I multiply my divisor, 385, and the product is 3080, which is still greater than the said dividu-

0

4

e-

to

0,

lal

vn

07

the dual Jnit the

iduall; al; wherefore I chuse another Number yet an Unit lesser, viz. and having multiplied my divisor thereby, the product is 2695, which is lesser than the dividual 2865, wherefore I put 7 in the Quotient and substract 2695 from the dividual 2865, and there remain 170; then I draw down the last sigure (3) in the dividend, and place it before the said Remainder 170, and it makes 1703 soi a

new dividual; then; (for the Reafon aforesaid) I seek how often 3 is contained in 17, the Answer is 4, but multiplying the divisor thereby, the Product is 1925, greater than the dividual, wherefore I say it will bear 4 (an Unit lesser) and by it I multiply the Divisor 385, and the Product is 1549, which is lesser than the Dividual, and therefore I put 4 in the Quotient, and substract the said Product from the dividual,

385) 1183653 (3074

and there remain 163; and thus the work is finished; and I find that 1183653 being divided by 385, or into 385 equal Shares or parts, the Quotient (or one of those parts) is

3074, and besides there is 163 remaining.

And thus the Learner being well versed in the Method of the forgoing Example, he may be sufficiently qualified for the dividend of any greater Sum or Number into as many Parts as he pleaseth; that is, he may understand the Method of dividing by a divisor, which consistent of 4, or 5, or 6, or any greater Number of places, the Method being the same with the forgoing Example in every Respect.

So if you divide 47386473 by 58736, you will find the Quotient to be 896, and 45257 will remain after the Work is e ded.

In like Manner, If you would divide 3846739204 by 413064, the Quotient will be 7963, and the Remainder after the Division will be 100572.

Compendium in Division.

I Fany given Number be to be divided by another Number that hath Cyphers annexed on the right Side thereof, ometting the Cyphers, you may cut off to

many Figures from the right Hand of the Dividend, as there are Cyphers before the Divisor, and let the remaining Numbers in the Dividend, be divided by the remaining Number or Numbers of the Divisor, observing this Caution: That if after your Division is ended, any Thing remain, you are to annex thereto the Number or Numbers that were cut off from the Dividend; and such no v found Number shall be the Remainder. (S. Mr. Oughtred's Clavis Mathematica, cap. 5. 3.) As for Example, Let it

be required to divide 46658 by 400, now because there are two Cyphers before the Divisor, I cut off as many Figures from before the Dividend, viz. 58, so that then there will remain only 466 to be divided by 4, and the Quotient will be 116, and there will remain 2, to which I annex the two Figures (58) which were cut off from the Dividend, and it makes

4 6

466 58

(258)

4 (00)

258 for the true Remainder; so that I conclude 46658 being divided by 400, the Quotient will be 116, and 258 remain after the work is ended; as by

the Work in the Margin.

2. And hence it followerk, that if the Divisor be r, or an Unit with Cyphers annexed, you May cut of fo many Figures fr m before the Dividend, as there are Cy hers in the Divilor, and then the Figure or Figures that are on the left Hand will be the Quotient, and those that are on the right Hand will be the Remainder after this Division is ended. (Vid. G m. Prif. Arith. Par. 1) As thus; if 45783 were to be divided by 10, I cut off the last Figure (3) with a Dath thus, 4578 3, and the Work is done, and the Quotient is 4578 (the Number on the left Hand of the Dash) and the Remainder is 3 (on the right Hand.) In like Manner if the same Number 45783 were to be divided by 100, I cur of two Figures from the End thus, 457183, and the Quotient is 457, and the Remainder is 83 And if I am to divide the same Figure by 1000, I cut off 3 from the End thus, 45/783, and the Quotient is 45, and 783 is the Remainder, &c.

her ght io

he

rk

any

7-

6. The general Effect of Division, is contained in the Definition of the same, that is by having two unequal Numbers, to find a third Number in such Proportion to the Dividend, as the Division hath to an Unit or 1: It also discovers what Reason or Proportion there is between Numbers; to if you divide 12 by 4, it quotes 3, which shews the Reason or Proportion of 4 to 12 is triple.

The fecond Effect is, by the superficial Measure or Content, and the Length of any Oblong, Rectangular Parallelogram, or square Plane known, to find our the Breadth thereby; or contratiwise, by having the Superficies and also by having the Solidity and Length of a Solid, to find

the Superficies of the Bale. &c. contra.

The third Effect is, by the Contents, Reason, Price, Value, Buying, Selling, Expences, Wages, Exchange, Interest, Profir, or Loss of any Number of Things (he it Money, Merchandize, or what else) to find our the Content, Reafon, Price, Value, Buying, Selling, Experces, Wages, Exchange, Interest, Profit, or Loss of any one Thing of the like Kind.

The fourth Effect is, to aid; to compass, and to make other Rules, but principally the Rule of Proportion, called the Golden Rule, or Rules of Three, and the Reduction of Monies, Weights, and Measures is one Describination into another, by it also Fractions are observated by finding a common Measure unto the Name after and Denominator, thereby discovering commensurable Numbers.

If you divide the Value of any certain Quantity by the same Quantity, the Quotient discovers the Rate or Value of the Integer: As it 8 Yards of Clash cost 96 s. what will I Yard? You divide 96 by 8, and the Quotient is

12 s. which is the Price of I Yard.

If you divide the Value or Price of any unknown Quantity, by the Value of the Integer, it gives you in the Quotient that unknown Quantity, whole Price is thus divided, as if 12 Shillings were the Value of a Yard, I would know how many Yards, are worth 96 Shillings: Here if you divide (96) the Price or Value of the unknown Quantity, by 12, the Rate of the Integer, or 1 Yard, the Quotient will be 8, which is the Number of Yards worth 96 s.

Some Questions answered by Division may be these following.

Quest. 1. If 22 Things cost 66 Shillings, what will the fuch Thing cost? Facit 3 Shillings, for you divide 66 by 22, the Quotient is 3 for the Answer; so if 36 Yards or Ells of any Thing be bought or sold for 108 l. how much will one Yard or Ell be bought or sold for? Facit 3 l. for if you divinde 108 by 36 Yards, the Quotient will be 3 l. the Price of the Integer.

Quest. 2, If the Expence, Charges, or Wages of 7 Years, amount to 868 l. what is the Expence, Charges, or Wages of one Year? Facit 124 l. for it you divide 863 (the Wages of 7 Years) by 7 (the Number of Years) the Quotient will be 124 l. for the Answer. See the Work:

Quest. 3. If the Content of 1 superficial Foot be 144 Inches, and the Breadth of a Board be 9 Inches, how many Inches of that Board in Length will make such a Foot? Facit 16 Inches; for by dividing 144 (the Number of square Indches in a square Foot) by 9 (the Inches in the Breadth of a Board) the Quotient is 16 for the Number of Inches in Length of that Board to make a superficial Foot.

Quest. 4. If the Content of an Acre of Ground be 160 fquare Perches, and the Length of a Furlong (propound d) be 80 perches, how many Perches will there go in Breadth to an Acre: F cit 2 perches; for it you divide 160 the Number of perches in an Acre, by 80 (the Length of the Furlong in perche) the Quotient is 2 perches; and 10 many in Breadth of that Furlong will make an Acre.

80) 160 (2 perches.

160

(0)

Quef. 5. If there be 893 Men to be made up into a Battle, the Front confifting of 47 Men; what Number must there be in the File? Facit, 19 deep in the File; for if you divide 893 (the Number of Men) by 47, the Number in the Front, the Quotient will be 19 in Depth of the File. The Work followerh.

47) 893 (19 Deep in File.

47

423

423

(0)

Quest. 6. There is a Table whose superficial Contents is 72 Feet, and the Breadth of it at the End is 3 Feet; now I demand what is the Length of this Table? 3) 72 (24 Facit 24 Feet long; for if you divide 72 (the Content of the Table in Fee) by 3 (the Breadth of it) the Quotient is 24 Feet for the Length thereof, which was required. See

12 the Operation.

The proof of Multiplication and Division.

Multiplication and Division interchangeably prove each other; for it you would rove a Sum in Division, whether the Operation be right or no, multiply the Quotient

by the Divisor: and if any thing remain after the Divisor is ended, add it to the product, which product (a your Sum was rightly divided) will be equal to the Dividend. And contrariwite, it you would prove a Sum in Multiplication, divide the product by the Multiplier, and if the Work was rightly performed, the Quotient will be equal to the Multiplicand. See the Example, where the Work is done and undone. Let 7654 be given to be multiplied by 3242, the product will be 24814268, as by the Work appeareth.

24814268

22962

And then if you divide the faid product 24814268 by 3242 the Multiplier, the Quotient will be 7654, equal to the given Multiplicand.

3242) 24814268 (7654

In like Manner to prove a Sum or Number in Division) if 24814268 were divided by 3242, the Quotient will be found to be 7654; then for proof, if you multiply 7654 the Quotient, by 3242 the Divisor, the product will amount to 24814268, equal to the Dividend.

Or, you may prove the last, or any other Example in Multiplication thus, viz. divide the product by the Multiplicand, and the Quotient will be equal to the Multiplier.

See the Work.

From whence there arises this Corollary, that any Operation in Division, may be proved by Division; for if after your Division is ended, you divide the Dividend by the Quotient, the new Quotient thence arising will be equal to the Divisor of the first Operation; for Trial whereof, let the last Example be again repeated.

3242) 24814258 (7654

27694	
21202 19452	
17506	
1296	
(0)	-

For Proof whereof divide again 24814268 by the Quatient 7654, and the Quorient hence will be equal to the Divifor 3242. See the Work.

7654) 24814268 (3242

But in proving Division by Division, the Learner is to observe this following Caution: That if after his Division is ended, there be any Remainder, before you go about to prove your Work, substract the Remainder out of your Dividend, and then work, as in the following Example, where it is required to divide 43876 by 765, the Quotient here is 57, and the Remainder is 271, See the Work following.

765) 43876 (57

Now to prove this Work, substract the Remainder 27 r out of the Dividend 43876, and there remaine h 43605, for a new Dividend to be divided by the former Quotient 57, and the Quotient thence arising is 765, equal to the given Divisor, which proveth the Operation to be right.

D 4

43875

(0)

285 285

Thus have we gone through the four Species of Arithmetick, viz. Addition, Substraction, Multiplication, and Division, upon which all the following Rules, and all other Operations whatsoever that are possible to be wrought by Numbers, have their immediate Dependance, and by them are resolved. (Vide Gem. Fris. Arith. part I) Therefore before the Learner makes a farther Step in this Art, let him be well acquainted with what has been delivered in the foregoing Chapters.

#### CHAP. VIII.

### Of Reduction.

Reduction is that which brings together two or more Numbers of different Denominations into one Denomination, (Hall's Arith. c. 13. p. 152.) or it ferveth to change or alter Number, Money, Weight, Measure or Time; from one Denomination to another; and likewife to abridge Fractions to the lowest Terms. All which it doth precisely, that the first proportion remaineth without the least Jot of Error or Wrong committed; so that it belongeth as well to the Fractions as Integers of which in the proper place. Reduction is generally performed by Multiplication or Division; from whence we may gather, that,

2. Reduction is either Ascending or Descending.

and

3. Reduction descending, is when it requireth to reduce a Sum or Number of a greater Denomination, into a leffer; which Number, when it is so reduced, shall be equal in Value to the Number first given in the greater Denomination; (Wing's Arith. 7, 2, 3, 4.) as if it were required to know how many Shillings, Pence, or Farthings, are equal in Value to 100 l. Or how many Ounces are contained in 4500 lb. Weight. Or how many Days, Hours, or Minutes, there are in 240 Years, &c. And this Kind of Reduction is generally performed by Multiplication.

4. Reduction Afcending is when it is required to reduce or bring a Sum or Number of a smaller Denomination into a greater, which will be equivalent to the given Number, as suppose it were required to find out how many Pounds, Shillings, or Pence are equal in Value to 43785 Farthings; Or how many Hundreds are equal to (or in) 3748 Pounds, and this Kind of Reduction is always performed by

Division.

;

if

5. When any Sum or Number is given to be reduced into another Denomination, you are to confider whether it ought to be refolved by the Rule descending or ascending, &c. by Multiplication or Division; if it be to be performed by Multiplication, confider how many Parts of the Denomination into which you would reduce it, are contained in an Unit, or Integer of the given Number, and multiply the said given Number thereby, and the Product thereof will be the Answer to the Question. As if the Question were in 38 Pounds how many Shilling; here I confider, that in a Pound are 20 Shillings, and that the 38 Number of Shillings in 38 Pounds will be 20 times 20 38, wherefore I multiply 38 L by 20 and the Product is 760, and so many Shillings are contained in 760 38 Pounds as in the Margin.

But when there is a Denomination or Denominations between the Number given and the Number required, you may, if you please, reduce it into the next interior Denomination, and then into the next lower than that, &c. until you have brought it into the Denomination required. As for Example, Let it be demanded in 132 Pounds how many Farthings? First, I multiply 132 (the Number of Pounds given) by 20, to bring it into Shillings

D

Chap. 8.

and it makes 2640 Shillings, then do I multiply the Shillings 2640 by 12, to bring them into Pence, and it produceth 31680, and to many Pence are contained in 2640 Shillings, or 132 Pounds; then do I multiply the Pence, viz. 31680 by 4 to bring them into Farthings (because 4 Farthings are a Penny) and I find the Product thereof to be 126720, and so many Farthings are equal in Value to 132 Pounds. As by the Work in the

2640 Shill.

5280 2640 31680

4

Margin.

6. And if the Number propounded to be reduced is to be divided or wrought by the Rule ascending, consider how many of the given Numbers are equal to an Unit, or Integer in that Denomination to which you would reduce your given Number, and make that your Divisor, and the given Number your Dividend; and the Quotient thence arising will be the Number sought or required: As for

Example, let it be required to reduce 2640 Shillings into Pounds. Here I confider that 20 Shillings are equal to one Pound; wherefore I divide 2640 (the given Number) by 20, and the Quotient is 132, and fo many Pounds are contained in 1640 Shillings. In Reduction descending and ascending, the Learner is advised to take particular Notice of the Tables delivered in the tecond Chapter of this Book, where he may be informed what Multipliers and Divisors to make Ute of in the reducing of any Number to any other

20) 2640 (132

Denomination whatfeever, especially English Money, Weights, Measures. Time, and Motion; but in this Place it is not convenient to meddle with Foreign Coins, Weights, or Measures.

But if in Reduction ascending, it happen that there is a Denomination or Denominations between the Number giuen and the Number required, then you may reduce your Number Number given into the next superior Denomination, and when it is so reduced, bring it into the next above that and so on until you have brought it into the Denomination required. As for Example Let it be demanded in 12670, Farthings how many Pounds? First I divide my given Number, being Farthings, by 4, to bring them into Pence, (because 4 Farthings make one Penny) and there are 31680. Pence; then I divide 31680 Pence by 12, and the Quotient giveth 2640 Shillings, and then I divide 2640 Shillings by 23, and the Quotient giveth 132 Pounds, which are equal in Value to 126720 Farthings: See the whole work as it followeth.

4) 126720 (31680 (2640 (132

7. When the Number given to be reduced conflictent of diverte Denominations. as Poudds, Shillings Pence, and Farthings, or of Handreds, Quarters; Pounds, and Ounces, &c, then you are to reduce the highest (or greatest) Denomination into the next Inferior, and add thereunto the Number standing in the Denomination, which your greatest or highest Number is reduced to; then reduce the Sum into the next inferior Denomination; adding thereto the Number standing in that Denomination;

	7. 48 20	s. 13	d.
Add	960	Shil	2.
Sum	973		_
	1946		
I Add	1670	P	ence
Sum	11686	-	

do fo until you have brought the Number given into the Denomination proposed. As if it were required to reduce 48 l. 13 s. 10 d. in Pence; first I bring 48 l. into Shillings, by multiplying it by 20, and the Product is 960 Shillings; to which I add the 13 Shillings, and they make 973; then I multiply 973 by 12, to bring the Shillings in to Pence, and they make 11676, to which I add the 10 d. and they make 11676 Pence for the Answer.

8. If in Reduction afcending, after Division is ended, any Thing remain, such Remainder is of the same Deno-

mination with the Dividend.

Example. In 4783 Farthings, I demand how many Pounds.

First, I divide the given Number of Farthings, viz. (4783) by 4, to bring them into Pence, and the Quotient is 1195, and there remaineth 3 after the Work of Division is ended, which is 3 Farthings.

Again, I divide 1195 Pence (the faid Quotient) by 12, to reduce them into Shillings, and the Quotient is 99 Shillings, and there is a Remainder of 7, which is 7 Pence,

And then I divide 99 Shillings (the last Quotient, by 20, to bring it into Pounds, and the Quotient is 41 and there remainted 19 Shillings; so that I conclude that in 4783 (the proposed Number of Farthings) there is 4 Pounds, 19 Shillings, 7 Pence, 3 Farthings: View the following Operation:

Rem. (3) Farthings.

# More Examples in Reduction of Cein.

Quest. r. In 4381. how many Facit 8760 Shillings; for by mult 438 by 20, the product amount	Shillin	gs? the	4381.
much. See the Work in the Mary Quest. 2. In 467 l. how many pence? First multiply the given	gin.	Facit	8760 s. Pounds
Number of pounds (467 by 20, to- bring it into Shillings, and it makes		9340	Shill.
Shillings by 12, and it produceth 112080 pence, as in the Margin.		18680 9340	
Or it may be refolved thus, viz. multiply the given Number of	Facit	112080 467 240	Poun.
Pounds 467, by 240, the Number of pence in a pound, and the pro-		18680 934	
duct is the same, v 2.112080pence- as by the Operation appeareth.	Facit	112030	Penc.

	5673 Pounds
	113460
	226920 113460
	1361520 Pen.
Facit	5446080

Or this Question might have been thus refolved, viz. multiply 567; the given Number of the Pounds by 960 (the Number of Farthings in a Pound) and it produceth the same Effect, as you may see by the Work.

5673 960	Pounds		Shillings
340380 51057		240	Pence

Facit 5446080 Farthings 960 Farthings.
Otherwise thus: First bring the given Number 5673 1.
in Shillings. and multiply the Shillings by 48, the Number of Farthings in a Shilling, and the same Essect is there-

by likewife produced. viz.

5673 Pounds	12 Pence 4
113460 Shillings	48
907680 453840	

Facit 5446080

These various Ways of Operation are expressed to inform the Judgment of the Learner, with the Reason of the Rule. More Ways may be shewn, but these are sufficient

even for the mean it Capacities.

Quest. 4. In 4581. 16 s. 7 d. 3 qrs. hew many Farthing? to refolve this Question, consider the 7th Rule of this Chapter, and work as you are there directed, and you will find the aforesaid given Number to amount to 440479 Farthings, viz.

s. d. grs. 16 7 458 20 160 Shillings Add 16 Sum 9176 Skillings. 18352 9176 119112 Pence Sum 116110 Pence 440476 Farthings Sum 440479 Farthings.

This last Question, or any other of this Kind, may be more concisely resolved thus, viz. When you mulciply the Pounds by 20, to bring them into Shillings, to the Product of the first Figures, add the Figure standing in the Place of Units in the Denomination of Shillings; but because the first Figure in the Multiplier is (o) I say, o times 8 is nothing, but 6 is 6, which I put down for the first Figure in the Product, then because the Multiplier is o, I go on no farther with it; for if I should, the whole Product will be o, but proceed; and when I come to multiply the fecond Figure in the Multiplier, to the Product of it, I add the Figure standing in the Place of Tens in the Denomination of Shillings, which is 1, faying, 2 rimes 8 is 16, and (the faid Figure) t is 17; then I fet down 7, and carry the Unit to the Product of the next Figure, as is directed in the 5th Rule of the 6th Chapter foreging, and finish the Work. So that now you may have the whole Product

Chap. 8.

Product and Sum of Shillings at one Operation, which is the same as before; and when you Multi, ly the Shillings by 12, to bring them into Pence, after the same Manner, add to the Product the Number standing in the Denomination of Pence, and so when you multiply the Pence by 4, to bring them into Farthings, add to the Product the Number standing under the Denomination of Farthings. See the last Question thus wrought.

Facit 440479 Farthings.

After the Method last prescribed, are all the following Examples, that are of the same Nature, wrought and refolved.

21 ft. 5. In 4375866 Farthings, I demand how many

Pounds, Shillings, Pence, and Facilings?

To refolve this Quettien, First, I divide the given Number of Farthings by 4, and the Quotient is 1093966 Pence, and there remainesh 2 after the Division is ended, which, by the 8th Rule foregoing, is 2 Farthings; then I divide 1093966 Pence by 12, and the Quotient is 91163 Shillings, and there remainesh 10 after Division, which by the said 8th R le is 10 many Pence, with 10 divide 91163 Shillings by 20, and the Quotient 4558 L and there remainesh 3 Shillings; so the Work is similarly, and I find that in 4375866 Farthings, here are 4558 L 3 s. 10 d. 2 grs.

4) 4375866	(12)	20 1. (9116)3 (4558

Quest. 6. In 4386 l. I demand how many Groats?
To resolve this Question, I reduce the given Number of pounds into Shillings, and there are 87720 Shillings; now I consider that in a Shilling are 3 Groats, therefore I multiply the Shillings by 3, and it produceth 263160 Groats.

See the Work :

y

n 6

1,

n 3 h

1.

d,

2

4386 Pounds 20 87720 Shillings 3

Fac. 263160 Greats.

This Question might have been otherwise resolved thus, viz. consider that in a pound (or 20 Shillings) there are three Times 20 Groats, which makes 60, by which I multiply the Number of pounds given, and it produceth the same Effect at one Operation, as followeth.

4486 Pounds 60 Greats in 20 s.

Facit 263160 Groats 4386 1.

Queft. 7. In 43758 Three-pencs, I defire to know how ma-

ny Pounds?

To resolve this, and many such like Questions: First, I divide my given Number of Three-pences by 4, because 4 Three pences are in a Shilling, and the Quotient is 10939 Shillings, and there remaineth 2 after the Division is ended, which are 2 Three-pences (by the 8th Rule of this Chapter) which are equal in Value to 6 d. then I divide 10939 Shillings by 2, and the Quotient giveth 5461. and 193. remains: So that I conclude in 43578 pieces of Three-pence per Piece, there-are 5461. 193. 6 d. as by the Work appeareth:

4) 43758 2 0 1. s. d. (1093'9 (546 19 06)

114 re. 108	(19) Sh.			

(6) Pence remains.

Or thus; divide the given Number of 3 Pences by the Number of Three-pences in a Pound, or 20 Shillings (which you will find to be 80. if you multiply 20 s. by 4, the Number of Three-pences in a Shilling, and you will find the Quotient to be 546 l. as before, and a Remainder of 78 Three-pences; and if you divide those 78 Three-pences by 4 (because there are 4 Three-pences in a Shilling, you will find the Quotient to be 19 s and 2 Three-pences remain, which are equal to 6 d. which is the same that was before found.

19 6	20 4
	80
	19 6

(2) Three-pences, or 6 d.

Queft. 8. In 4785 l. 13 s. how many Pieces of 13 d. \$

per Piece?

The Question cannot be resolved by Reduction descending or ascending absolutely, because 13d; is no even part of a Pound, but rather by them both journly, viz. by Multiplication and Division, but it you bring the Number given into Half pence, and Divide the Half-pence by the Half-pence in 13d. \frac{1}{2}, viz. 27, the Quotient will be the A swer; for having brought 4785 l. 13 s. into Half-pence, I find it makes 2207112, which I divide by 27, because there are so many Half pence in 13d. \frac{1}{2}, and the Quote gives 85078 pieces of 13d. \frac{1}{2}, and 6 Half-pence remain over and above: Observe the Work following.

1. s.	d
4785 13	135 013
95713 Shillings 24 Half-pence in	27 Half-pence n a Shilling.

382852 191426

2297112 Half-pence in the given Number. 27) 2297112 (85078 Pieces of 13 d. 1.

2	I	6			
		3			
		777	8	9	
				2	

Remains (6 Half-pence.

It would have produced the same Answer, if you had reduced your given Number into Farthings, and divided by the Farthings in 13 d \frac{1}{2}, v.z. 54; for always the Dividend and the Divisor must be of one Denomination, and then you would have had a Remainder of 12 Farthings, which are equal in Value to the former Remainder of 6 Half pence, as you may prove at your Leisure.

Qu'ft. 9. In 540 Dollars at 41. 4d. per Dollar, how

many Pounds Sterling?

First, bring your given Number of Dollars into Pence, and then your Pence into Pounds, according to the former Directions, Thus in 4s. 4d. viz. a Dollar, you will find 52 Pence, by which multiply 540 Dollars, and it produceth 28080 pence, which if you divide by 240 (the pence in one pound) the Quotient will give you 117 h, which are equal in Value to 540 Dollars, at 4s. 4d. per 540

	s. d.

y

if

Quest. 11. In 4386 l. I demand how many Pieces of 6 d. of 4 d. and of 2 d. of each an equal Number? That is to fay, What Number of Six-pences. Groars, and Two pences

will make 4386 L and the Number of each equal ?

The Way to resolve Questions of this Nature, is to add the several Pieces into which the given Number is to be brought into one Sum, and reduce the given Number into the same Denomination with their Sum, and to divide the said Number (so reduced) by the said Sum, and the Quotient will give you the exact Number of each Piece. And after the same Method will we proceed to resolve the present Question, viz.

	4386. Po 240 Pend	unds ce	6 d 4 d.
	175440 8772		2 d.
12)	96 92 84	87720	
	86 84		
	24 24		
	(0)		

So that I conclude by the Operation, that 87720 Sixpences, and 87720 Groats and 87720 Two-pences, are just as much, or equal to 4386 L or if you admit of 5 s. to be thus divided, it is equal to 5 Sixpences. and 5 Four-pences, or Groats, and 5 Two pences.

Another Queftion of the same Nature with the last, be this

following, viz.

Quest. 12. A Merchant is defirous to change 148 l. into pieces of 13 d. \frac{1}{2}, of 12 d. 9 d. 6 d. and of 4 d. and he will have of each Sort an equal Number of pieces, I defire to know the Number?

Do as you were raught in the last Quettion, viz. add the several pieces together, and reduce the Haif pence, then reduce the Sum to be changed, viz. 1481. into the same De omination, and divide the greater by the Lesser, And in the Quotient you will find the Answer, viz. 798 is the Number of each of the pieces required, and 18 remaineth, which is 18 Half pence by the 8th Rule of this Chapter. See the Work as followeth:

S

71040 Half-pence. 89 Half pence. 89) 71040 (798 Pieces of each Sort.

Rem. (18) Half-pence.

The Truth of the two foregoing Operations will thus be proved, viz. Multiply the Answer by the Parts or Pieces into which the given Number was reduced, and having added the several Products together, if their Sum be equal to the given Number, the Answer is right, otherwise not; so the Answer to the 11th Question was 87720; which is proved as followerh, viz.

87720 Six-rences make—2193
Four-Pences make—1462
Two-pences make—731

The Total Sum of them 4386 which was the Sum given to be changed.

The Answer to the 11th Question was 758, and 18 Halfpence remained after the Work was ended, now the Truth of the Work may be proved as the former, viz.

		2.		d.
	Pieces of 13 1 make	- 44	17	09
	Pieces of 12 make -	- 39	18.	00
798	Pieces of 9 make-	-29	18	06
	Pieces of 6 make-	-19	19	00
	Pieces of 4 make-	-12	06	00
and 18 F	Half pence, or 9 d. remain -	- 00	00	09

The Total Sum of them 148 00 00 which Total Sum is equal to the Number that was first given to be changed, and therefore the Operation was rightly performed.

Reduction of Troy-weight.

We come now to give the Learner a few Examples in Troy-weight; in working whereof he must be mindful of the Table of Troy weight delivered in the second Chapter of this Book.

Queft. 13. In 482 l. 702. 13 p. w. 21 gr. how many

Grains?

Multiply by 12, by 20 and by 24, taking in the Figures standing in the several Denomination, according to the Direction given in the Seventh Rule of this Chapter, and you will find the Product to be 2780013 Grains, which is the Number required, or Answer to the Question. See the whole Work, as in the Margin.

Remain 21 Grains.

Que.4. 15. A Merchant fent to a Goldsmith 16 Ingots of Silver, each containing in Weight 2 1. 4 cz. and ordered it to be made into Bowls of 2 1 8 cz. per Bowl, and Tankards of 1 1. 6 cz. per Piece, and Salts of 10 cz. 10 p. w. per Salt, and Spoons of 1 cz. 18 p. w. per Spoon, and of each an equal Number; I desire to know how many

of each Sort he must make?

The Question is of the same Nature with 11th and 12th Question foregoing, and may be answer'd after the same Method, viz. First, add the Weight of the several Vessels, into which the Silver is to be made, into one Sum, and reduce to one Denomination, and they make 1248 Penny weights; then reduce the Weight of the Ingot into the same Denomination, viz. Penny weights, and it makes 560 Penny-weights, and multiply them by the Number of Ingots, viz 16, and the Product will give you the Weight of the 16 Ingots, viz. 8960; then divide the Product by the Weight of the Vessels, viz. 1248, and the Quotient giveth you the Answer to the Question, viz. 7, and 224 p. w. remaineth over and above.

E 2

00 00 Salts of o 10 10 per Salt, is 06 CI 10 Spoons of o 18 per Spoon, is OI **c**6 OI 01 224 Penny-weight remaining 00 11 04

37 04 00

So that you see the Sum of the Weight of each Vessel, together with the Remainder, is 37 lb. 4 oz. which is equal to the Weight of the 16 Ingots delivered. For if 37 lb. 4 oz. be reduced to Penny-wts, it makes 8960.

Reduction of Averdupois-weight.

In reducing Averdupois-weight the Learner must have Recourse to the Table of Averdupois-weight, deliver'd in the second Chapter.

Queft. 16. In 47 C. 1 qr. 20 16. how many Ounces? Multiply by 4, by 28, and 16, and the last Product will be the Answer, viz. 84992 Ounces. See the Margin.

114048000 Feet about the Earth 12 Inches in a Foot

229096000

13685,6000 Inches about the Barth

3 Barley-corns in an Inch

Fa. 4805728000 Barley-corns.

And so many will reach round the World, the whole being about 21600 Miles; so that if any Person were to go round, and go 15 Miles every Day, he would go the whole Circumference in 1140 Days; which is 3 Years, 11 Months, and 15 Days.

Reduction of Time.

Quest. 23. In 28 Years, 24 Weeks, 4 Days, 16 Hours,
30 Minutes. how many Minutes?

Years Weeks Days Hours Minutes.

28 24 4 16 30

52 Weeks in a Year

60

142

1480 Weeks

7

10364 Days

24

41462

20729

248752 Hours

60

14925150 Minutes.

Note, That in resolving the last Question after the Method expressed, there is lost in every Year 30 Hours. For the Year consistent of 365 Days and 6 Hours; but by multiplying the Year by 52 Weeks, which is 364 Days you lote I Day and 6 Hours every Year, wherefore to find an exact Answer, bring the odd Weeks, Days and Hours into Hours, and then multiply the Years by the Number of Hours in the Year, viz. 8766, and to the Product add the Hours contained in the odd Time, and you have the exact Time in Hours, which bring into Minutes, as before. See the last Question thus resolved:

			Weeks 24 7	Days 4	Hour!
28 8766	365	Hours 6	172 24		
172	1466		694 345		
197		Hours in	a Year.	urs	
49592 H	ours.				

60

14975520 Minutes in 28 Years, 4144 Hours.

So you fee that according to the Method first used to refolve this Question, the Hours contained in the given Time are 248752, but according to the latt, best, or truest Method, they are 249592, which exceeds the former by 840 Hours.

But for most Occasions it will be sufficient to multiply the given Years by 365, and to the Product add the Days in the odd Time, if there be any, and then there will be only a lofs of 6 Hours in every Year, which may be supplied by taking a fourth Part of the given Years, and adding it to the contained Days, and you have your Defire.

Quell. 24. In 438657540 Minutes, how many Years?

Facet. 834 Years, 4 Days, 19 Hours.

Queff. 25. I defire to know how many Hours and Minutes it is fince the Birth of our Saviour Jefus, being accounted

1741 Years?

This Quettion is of the same Nature with the 24th foregoing, and after the same Manner is resolved, viz. multiply the given Number of Years by 8766, the Product is 1 52616606 Hours, and that by 60, and the Product is or 5696360 Minutes. See the Work.

8766 10446 10446 12187. 13928

15261606 Hours in 1741 Years 9:5696360 Minutes

Note, That as Multiplication and Division do interchangeably prove each other, so Reduction descending and scending prove each other by inverting the Quettion, as the 13th and 14th, and likewise the 16th and 17th Questions foregoing by Inversion, do interchangeably prove each other. The like may be performed for the Proof of any Question in Reduction whatsoever.

## CHAP. IX.

Of Comparative Arithmetick; viz. The Relation of Numbers one to another.

Omparative Arithmetick, is that which is wrought by Numbers, as they are confidered to have Relation one to another, and this confifts either in Quantity or in Quality. See Boetius's Arith. Lib. 1. cap. 21.

2. Relation of Numbers in Quantity, is the Reference or Respect the Numbers themselves have one to another, where the Terms of Numbers propounded are always two, the first called the Antecedent, and the other the

Confequent. See Wing. Arithm.

3. The Relation of Numbers in Quantity confifts in the Differences, or in the Rate or Reason that is found betwixt the Terms propounded, the Differences of two Numbers being the Remainder found by Substraction, according to Alfred, but the Rate or Reason betwixt two Numbers is the Quotient of the Antecedent divided by the Confequent, so 21 and 7 being given, the Difference betwixt them will be found to be 14, but the Rate or Reason that is betwixt 21 and 7, will be found to be triple Reason, for 21 divided by 7, quotes 3, the Reason or Rate.

4. The Relation of Numbers in Quality, otherwise called Proportion, is the Reference or Respect that the Reason of Numbers have one unto another; therefore the Terms given ought to be more than two. Now the Proportion or Reason between Numbers relating one to another, is either Arithmetical or Geometrical.

5. Arithmetical Proportion is, when diverse Numbers differ one from another by equal Reason; that is, have equal Differences.

So this Rank of Numbers, 3, 5, 7, 9, 11, 13, 15, 17,

differ by equal Reason, viz. by 2, as you may prove.

6. In a Rank of Numbers that differ by Arithmetical Proportion, the Sum of the first and last Term being multiplied by half the Number of Terms, the Product is the total Sum of all the Terms.

Or, if you multiply the Number of the Terms by the half Sum of the first and last Terms, the Product is the

total Sum of all their Terms.

So in the former Progression given, 3 and 17 are 20, which multiplied by 4, viz. Half the Number of Terms, the Product gives 80, the Sum of all the Terms; or multiply 8, the Number of Terms by 10, half the Sum of the first and last Term, the Product gives 80 as before,

So also, 21, 18, 15, 12, 9, 6, 3, being given, the Sum of all the Terms will be found to be 84; for here the Number of Terms is 7, and the Sum of the first and last, viz. 21 and 3, is 24, half whereof, viz. 12, multiplied by 7,

produceth 84, the Sum of the Terms fought.

7. Three Numbers that differ by Arithmetical Proportion, the Double of the Mean, or middle Number, is equal to the Sum of the Extreams.

So 9, 12, and 15, being given, the Double of the Mean 12, viz. 24, is equal to the Sum of the two Ex-

treams, 9, and 15.

8. Four Numbers that differ by Arithmetical Proportion (either contained or interrupted) the Sum of the two Means

is equal to the Sum of the two Extreams.

So 9, 12, 18, 21, being given, the Sum of 12 and 18, will be equal to the Sum of 9 and 21, viz. 30, also 6, 8, 14, 16, being given, the Sum of 8 and 14 is equal to the Sum of 6 and 16, viz. 22, &c. See Wingate's Arith. c. 35.

9. Geometrical Proportion, by some called Geometrical Progression, is when diverse Numbers differ, according

to right Reaton.

So 1, 2, 4, 8, 16, 32, 64, &c. differ by Double Reason; and 3, 9, 27, 81, 243, 729 differ by triple Reason; 4, 17, 64, 256, &c. duers by quadruple Reason, &c.

10. In any Number that increase by Geometrical Proportion, if you multiply the last Term by the Quotient of any one of the Terms divided by another of the Terms which being less is next unto it, and having deducted, or fubftracted the firft Term out of that Product, divide the Remainder by a Number that is an Unit less than the said Quotient, the last Quote will be the Sum of all the Terms.

So 1, 2, 4, 8, 16, 22, 64, being given, first I take one of the Terms, viz. 8. and divide it by the Term which is less, and next to it, viz. by 4, and the Quotient is 2, by which multiply the left Term by 64, and the Product is 128, from whence I substract the first Term. viz. r, the Remainder is 127, which Dividend by the Quotient 2 made less by 1; viz. 1, the Quote is 127, for the Su Terms, as by the Work in the Margin.

So if 4, 16, 64, 256, 1024, were give

all the Terms will be found to be 1364. For first I divide 64, one of the Terms, by the next leffer Term, and the Quotient is 4, by which I multiply the laft Term 1024, and it produceth 4096; from whence I tubstract the first Term 4, and the Remainder is 4092, which I divide by the Quote less by 1, viz. 3, and the Quote 1364, for the total Sum of all

		12	8	
1	) 1	27	(127	
m	of	al!	given	
en,	th	e S	um of	
	6		1024	

4006 3) 4092 (1364

16) 64 (4

the Terms as per Margin.

11. Three Geometrical Proportionals given, the Square of the Mean is equal to the Rectangle, or Product of the Extreams.

So 8, 16, 22, being given, the Square of the Mean, viz. 16, is 256, which is equal to the Product of the Extreams 8 and 32, for 8 times 32 is equal to 256.

12. Of Four Geometrical proportionable Numbers given. the Product of the two Means is equal to the Product of

the two Extreams.

So 8, 16, 32, 42, being given, I fay, that the Product of the two Means, viz. 19 Times 32, which is 512, is equal to 8 times 64, the Product of the Extreams.

Alfo

Also if 3, 9, 21, 63, were given, which are interrupted, I say, 9 Times 21 is equal to 3 Times 63, which is equal

to 189.

From hence ariseth that precious Gem in Arithmetick, which for the Excellency thereof is called the Golden Rule, or Rule of Three.

## CHAP. X.

## Single Rule of Three Direct.

Golden Rule) is that by which we find out a fourth Number in Proportion unto three given Numbers, fo as this fourth Number that is fought may hear the same Rate, Reason, and Proportion to the third given Number, as the second doth to the first, from whence it is called the Rule of Proportion.

2. Four Numbers are faid to be proportional, when the first containeth, or it is contained by the second, as often as the third containeth, or is contained by the fourth. Vide

Wingate's Arith. Chap. 8. Sect. 4.

So these Numbers are said to be Proportionals, viz. 3, 6, 9, 18, for as often as the first Number is contained in the second, so often is the third contained in the fourth; viz. twice. Also, 9, 3, 15, 5, are said to be Proportionals; for as often as the first Number containeth the second, so often the third Number containeth the fourth, viz. 3 Times.

3. The Rule of Three is either Simple or Compound.

4. The Simple, or Single Rule of Three, confifteth of 4 Numbers, that is to tay, it hath 3 Numbers given to find out a Fourth, and this is either Direct or Inverse, Vide Alfread Math. lib. 2. c. 13.

5. The Single Rule of Three Direct, is when the Proportion of the first Term is to the second, as the third is to the fourth, or when it is required that the Number sought, viz. the sourth Number must have the same Pro-

portion to the fecond, as the third hath to the first.

6. In the Rule of Three, the greatest Dissiculty is to discover the Order of the 3 Terms of the Question propounded

pounded, viz. which is the first, second, and the third; which that you may understand; observe, that of the Three given Numbers, two always are of one Kind, and the other is of the same Kind, with the proportional Number that is sought; as in this Question, viz. If 4 Yards of Cloth cost 12 Shillings, what will 6 Yards cost at that Rate? Here the two Numbers of one Kind are 4 and 6. viz. they both signify so many Yards, and 125. is the same Kind with the Number sought, for the Price of 6 Yards is sought.

Again observe, That of the 3 given Numbers, those two that are of the same Kind, one of them must be the first. and the other the third, and that which is of the fame Kind with the Number fought, must be the second Number in the Rule of Three; and that you may know which of the faid Numbers to make your first, and which your third, know this, that to one of these two Numbers, there is atways affixed a Demand, and that Number upon which the Demand lieth, must always be reckoned the third Number. 'As in the forementioned Question, the Demand is affixed to the Number 6, for it is demanded, what 6 Yards will coft, and therefore 6 must be the third Number, and 4, which is of the same Denomination or Kind with it, must be the first, and consequently the Number 12 must be the fecond; and then the Number being placed in the forementioned Order, will stand as followeth, viz,

> yards s. yards 4 12 6

7. The next thing is, to find out the fourth Number in Proportion; which that you may do, multiply the fecond Number by the third, and divide the Product thereof by the first, or (which is all one) multiply the third Term, or Number, by the fecond, and divide the Product thereof by the first, and the Quotient thence arising is the 4th Number in a direct Proportion, and is the Number fought or Answer to the Question, and is of the same Denomination that the second Number is of. As thus, Let the same Question be again repeated, viz. If 4 yards of Cloth cost 12 Shillings, what will 6 Yards cost?

Having placed your Numbers according to the fixth Rule of this Chapter foregoing, I multiply the fecond Number 12, by the third Number 6, and the Product is 72, which product I divide by the first Number 4, and the Quotient thence arising is 18, which is the 4th Proportional or Number fought, viz. 18 Shillings, because the second Number is Shillings, which is the Price of 6 Yards, as was required by the Question. See the Work following.

yds If 4		12		yds 6		18
	4)	72 (18	Shillin	ngs		
		4				
		32 <b>3</b>	•			

Queft. 2. Another Question may be this, viz. If 7 C of Pepper cott 21 1 how much will 16 C. coft at that

Rate?

To refolve this Question, I consider that (according to the 6th Rule of this Chapter) The Terms or Numbers ought to be placed thus, viz. the Demand lying upon 16 C. it must be the third Number, and that of the fame Kind with it must be the first, viz. 7 C. and 21 1. being of the same Kind with the Number sought, must be the fecond Number in this Question; then I proceed according to the 7th Rule, and multiply the fecond Number, by the third, viz. 21 by 16, and the Product is 226, which I divide by the first Number 7, and the Quotient is 48 1. which is the Value of 16 C. of Pepperat the Rate of 21 1. for 7 C. See the Work following.

8. If when you have divided the Product of 2d and 3d Numbers by the first, any Thing remain after Division is ended, such Remainder may be multiplied by the Parts of the next inferior Denomination, that are equal to an Unit, or Integer, of the second Number in the Question, and the Product thereof divided by the first Number in the Question, the Quotient is of the fame Denomination with the Parts by which you multiplied the Remainder, and is Part of the 4th Number which is fought. And furthermore, if any Thing remain, after this last Division is ended, multiply it by the Parts of the next inferior Denomination equal to the Unit of the last Quorient, and divide the Product by the same Divisor, viz. The first Number in the Question, and the Quote is still of the same Denomination with your Multiplier; follow this Method until you have reduced your Remainder into the lowest Denomination, &c. An Example or two will make this Rule very plain, which may be the following.

Queft, 3. If 13 Yards of Velvet, &c. coft 21 %. what

will 27 Yards of the fame cost at that Rate?

is

rts

an

n, he an r, is

0in-

o. In the Rule of Three it many Times happens, that although the first and third Numbers be of one Kind, as both Money, Weight, Measure, &c. yet they may not be of one Denomination, or perhaps they may both confift of many Denominations; in which Cafe you are to reduce both Numbers to one Denomination; and likewife your fecond Number, if it confifteth at any Time of diverte Den minations, must be reduced to the least Name mention'd, or lower if you please, which being done, multiply the second and third together, and divide by the first, as is directed in the 7th Rule of this Chapter.

And note, that always the Answer to the Question is in the fame Denomination that your fecond Number is of, or

is reduced to, as was hinted before.

Queft. 5. If 15 Ounces of Silver be worth 3 1. 15 5. what

are 86 Ounces worth at that rate?

In this Question the Numbers being ordered according to the 6th Rule of this Chapter, the first and third Numbers are Ounce, and the fecond Number is of diverse Denominations, viz. 31. 15 s. which must be reduced to Shillings, and the Shillings multiplied by the third Number, and the Product divided by the first, gives you the Answer in Shillings, viz. 430 Shillings, which are reduced to 21 1. 10

In resolving the last Question the Work would have been the same, if you have reduced your second Number into Pence, for then the Answer would have been 5160 Pence, equal to 21 1. 10 3. or if you had reduced the second Number into Farthings, the Quotient or Answer would have been 20640 Farthings, equal to the same, as you may prove at your Leisure.

Quel. 6. If 8 1b. of Pepper coft 4 s. 8 d. what will

7 C. 3 grs. 14. 16: coft?

In this Question the first Number is 8 ib. and the third is 7 C. 3 qrs. 14 lb. which must be reduced to the same Denomination with the first, viz. into Pounds, and the second Number must be reduced into Pence; then multiply and divide according to the 7th Rule foregoing, and you will find the Answer to be 6174 Pence, which is reduced into 25 lb. 14 s. 6 d.

to 2510.

Quest. 9. Suppose the yearly Rent of a House, a yearly Pension, or Wages, be 73 l. I defire to know how much it is per Day?

Here you are to bring the Year into Days, and fay, is 365

(96)

Days require 73 1. what will one Day require?

1

e

lf

Remain

Now when you come to multiply 73 by 1, the Product is the same; for 1 neither multiplieth nor divideth, and 73 cannot be divided 364, because the Divisor is bigger than the Dividend; wherefore bring the 73 1. into Shillings, and they make 1460, which divide by the first Number

Number 365, and the Quote is 4 s. for the Answer: As you fee in the Work:

Days. 1. Day.

If 365 73 1
20

365) 1460 (4 s.
1460

Fac. 4 s. per Day.

(0)

Quest. 10. A Merchant bought 14 Pieces of Broad-Cloth, each Piece containing 28 Yards, for which he gave after the Rate of 13 s. 6 d. ½ per Yard, now I defire to know how

much he gave for the 14 Pieces at that Rate?

First find out how many Yards are in the 14 Pieces, which you will do if you multiply the 14 Pieces by 28, the Number of Yards in a Piece, and it makes 392; then say, If a Yard cost 13 s. 6 d. \(\frac{1}{2}\), what will 392 Yards cost? Work as followeth, and the Answer you will find to be 1274 to Half pence, which reduced, make 265 l. 8 s. 4 d. For after you have multipled your second and third Numbers together, the Product is 127400, which, according to the seventh Rule, should be divided by the first Number, but the fist Number is 1, which neither multiplieth nor divideth, and therefore the Quotient or 4th Number is the same with the Product of the second and third; which is in Half pence, because the second Number was so reduced. See the Work as solloweth.

By this Time the Learner is, as I suppose, well exercised in the practick and Theorick of the Rule of Three Direct; but at his Leifure he may look over the following Questions whole Answers were given, but the Operation purposely omitted as a Touchstone for the Learner, thereby to try his Ability in what hath been deliver'd in the former Rules.

Queft. 16. If 24 1. of Raifins cott 6 s. 6 d. what will r8 Frails coft, each weighing near 3 grs. 18 lb. Anf. 24 l.

171. 54.

Queft. 17. If an Ounce of Silver be worth & Shillings, what is the price of 14 Ingots, each Ingot weighing 7 lb. 5 0%. 10 p. w. Anf. 21 3 l. 5 s.

Queft. 18. If a piece of Cloth coft rol. 16 s. 8 d. I demand how many Ells Eng. there are in the fame, which Ell

at that Rate is worth 8 . 4 d. Anf. 26 Ells Eng.

Queft. 19. A Factor bought 84 pieces of Stuffs, which coft him in all 537 1. 12 1. at 5 1. 4d. per Yard, I demand how many Yards there were in all, and how many Ells Eng. were contained in a piece of the same? Anf. 2016 Yards in all, and 19 1 Ells of Eng. per piece.

Quel. 20. A Draper bought 242 Yards of Broad cloth. which coft him in all 254 1. 10 s. for 86 Yards, of which he gave after the Rate of 11s. 4 d. ger Yard, I demand how much he gave per Yard for the Remainder? Anf. 20 s.

9d, the Yard.

Queft. 21. A Factor bought a certain Quantity of Serge and Shalloon, which together cost him 126 l. 14s. 10 d. the Quantity of Serge he bought was 48 Yards, at 4 s. 4 d per Yard; and for every two Yards of Serge he had 5 Yards of Shalloon; I demand how many Yards of Shalloon he had, and how much the Shalloon coft him ger Yard? And, 120 Yards of Shalloon at Tl. 151. 5d. 150 per yard.

Queft. 22. An Oilman bought three Tuns of Oil, which coft him 151 & 14. " and fo it chanced that it leaked out 15 Gallons; but he is minded to fell it again, fo that he may be no Lofer by it; I demand how he must fell it per

Gallon ? Anf. at 4 s. 6 d. 174 per Gallon.

27eft. 23. Bought o packs of Cloth, each pach conaining 12 Cloths, which at 5 s. 4 d. Ell Flom. coft 1080 L. I demand how many yards there were in each Cloth & Auf. an Yards in each Cloth.

Queft.

Queft. 24. A Gentleman hath 535 l. per Ann. and bie Expences are, one Day with another, 18 s. 10 d. 3 grs. I defire to know how much he layeth up at the Year's End? Anf. 191 1. 2 s. 8d. 1 gr.

Quell. 25. A Gentleman expendeth daily one Day with another 27 s. 10 d. 1, and at the Year's End layeth up 340 l. I demand how much is his yearly Income? Anf.

848 L 145. 4 d. z.

Queft. 26. If I fell 24 Yards for 10 1, 10 s, how many Ells Flom. shall I fell for 283 1, 17 s. 6 d, at that Rate? Anf. 504 ! Ells Flom.

Queft. 27. If 100 l. in 12 Months gain 6 l. Intereft, how much will 75% gain in the fame Time, and at the

fame Rate ; Anf. 41. 10 s.

Queft. 28. If 100 l. in 12 Months gain 6 l. Intereft, how much will it gain in 7 Months at that Rate? Anf. 2 h. 10s.

Queft. 29. A certain Usurer put out 731. for 12 Months, and seceived Principal and Interest 81 1. I demand what Rate per Cent. he received Interes ? Anf. 81. per Cent.

Queft. 30. A Grocer bought 2 Chefts of Sugar, the one weigh'd near 18 C. 3 grs. 14 lb. at 21. 6 s. 8 d. per Cent. the other weigh'd near 18 C. 1 gr. at 4d. per 1b. which he mingled together; now I defire to know how much a C. wt. of this Mixture is worth ( Anf. 21. 4 s. 2 d. 267 grs.

Queft. 21. Two Men, viz A and B departed both from one Place, the one goes East, and the other West; " the one travelleth 4 Miles a Day, and the other 5 Miles a Day, how far are they diftant the 9th Day after their Departure? Auf. 81 Miles.

Quest. 32. A Flying every Day 40 Miles, is pursued the fourth Day after by B, posting 50 Miles a Day; now the Question is, in how many Days, and after how many Miles

Travel, will A be overtake?

Auf. Bovertakes him in 32 Days, when they have tra-

velled 600 Miles, See More's Arich. cap. 8. gr, 7.

11. The general Effect of the Rule of Three Direct, is contained in the Defidition of the fame, that is, to find a fourth Number in Proportion, confifting of two equal Reasons; as hath been fully thewn in all the foregoing Ex-

The fecond Effect is by the Price or Value of one Thing, to find the Price and Value of many Things of like Kind.

The third Effect is, by the Price or Value of many Things, to find the Price of one; or by the Price of many Things, the faid Price being one, to find the Price of many Things of like Kind.

The 4th Effect is, by the Price or Value of many, to find

the price or Value of many Things of like Kind.

The 5th Effect is thereby reduce any Number of Monies, Weights, Measures, to one Sort into the other, as in the Rules of Reduction contained in the 8th Chapter, foregoing. Examples of its various Effects have been alrea-

dy answered.

12. The Rule of Three Direct, is thus proved, viz. Multiply the first Number by the 4th, (The Proof of the Rule of Three Direct) and note the Product; then multiply the 2d Number by the 3d, and if this Product is equal to the Product of the 1st and 4th, then the Work is rightly performed, otherwise it is erroneous.

So the first Question of the Chapter, whose Answer or 4th Number we found to be 18 s. is thus proved, viz. the first Number is 4, which multiplied by 18, the 4th, produceth 72, and the fecond and third Numbers are 12 and 6. which multiplied together produce 72, equal to the Product of the ist and 4th, and therefore I conclude the Work

to be rightly performed.

Always observing, That if any Thing remain after you have divided the Product of the 2d and 3d Numbers by the first, fuch Remainder in proving the same, must be added to the Product of the 1st and 4th Numbers, whose Sum will be equal to the Product of the second and third, the fecond Number being of the same Denomination with the fourth, and the first of the same Denomination with the third.

So the fourth Question of this Chapter being again repeated, viz. If 141. of Tobacco cost 27 s. what will 4781. coft at that Rate? The Answer, or fourth Number, was 46 l. 1 s. 10 d. 1 gr. et. which is thus proved ; viz. bring the 4th Number into Farthings, and it makes 44294, which multiplied by the first Number 14, produceth duceth 619488 (the second which remaineth being added thereto; then, because I reduce my sourth Number into Farthings, I reduce my second viz. 27 s. into Farthings, and they are 1296, which multiplied by the 3d Number 478, heir Product is 619488, equal to the Product of the first and sourth Numbers. Wherefore I conclude the Operation to be true. This is an infallible Way to prove the Rule of Three Direct, and it is reduced from the 126 Section to the 9th Chapter of this Book.

And thus much for the inestimable Rule of Three Direct, the Denomination of which may be seen in Kersey's Appendix to Wingate's Arithm. and in the 7th Chapter of

Ougthred's Clavis Mathematica.

### CAAP. XI.

## The Single Rule of Three Inverse.

THE Golden Rule, or Rule of Three Inverse, is when there are 3 Numbers, given to find a 4th in such Proportion to the 3 given Numbers, so as the 4th proceeds from the 2d according to the same Rate, Reason or Proportion, that the first proceeds from the third, or the Proportion is,

As the 4th Number is in Proportion to the 2d, fo is the

ift to the 3d. See Alfread Math. 1. 2. c. 14.

So if 3 Numbers given were 8, 12, and 16, and it were required to find a fourth Number in an inverted Proportion to these, I say, that as 16, the third Number is the Double of the first Term or Number 3, so must 12, the second Number, by the Double of the 4th; so will you find the sourth Term or Number to be 6. (And as in the Rule of Three Direct) you multiply the second and third together, and divide their Product for a sourth proportionable Number.

2. In the Rule of Three Inverse, you must multiply the fecond Term by the first, or first Term by the fecond, and divide the Product thereof by the first Term, so the Quotient will give you the 4th Term sought in an inverted Proportion. The same Order being observed in this Rule is in the Rule of Three Direct, for placing and disposing of the

given

given Numbers, and after your Numbers are placed in order, that you may know whether your Question be to be refolved by the Rule Direct or Inverse, observe the general

Rule following.

3. When your Question is stated, and your Numbers orderly disposed, Consider in the first Place, whether the forth Term or Number fought, ought to be more or lefs. than the second Term; which you may eafily do: And if it is required to be more or greater than the 2d Term. then the leffer Extream must be your Divisor; but if it requires less, then the highest Extreme must be your Divifor; In this Cafe, the rft and 3d Numbers are called Extreams (in respect of the second) and having found out y) r Divisor, you may know whether your Question belong to the Rule Direct or Inverse; for if the 3d Term be your Divisor, then it is Inverse; but if the att Term be your Divifor, then it is a direct Rule. As in the following Q eflions.

Queft. 1. If 8 Labourers can do a certain Piece of Work in 12 Days, in how many Days will 16 Labourers do the

same ? Anf. in 6 Days.

Having placed the Numbers according to the 6th Rule

of the roth Chapter, I confider, that if 8 Men can finish the Work in 12 lab. Days lab. Days, 16 Men will do it in leffer for fewer Days) than 12, therefore the biggett Extream mutt be the Divisor, which is 16, and therefore it is the Rule of Three Inverse; wherefore I multiply the 1st and 2d Numbers together, viz. 8 by 12, and their Pro-

16) 96 (6 Days 96 (0) duct is co, which divided by 16, Facit 6 Days

quotes 6 Days for the Answer; and in to many Days will 16 Labourers perform a Piece of

Work, when 8 Men can do it in 12 Days.

Queft. 2. If when the Meafure, viz. a Peck, of Wheat coff 2 s. the Penny-Loaf weighed (according to the Standard Statute or Law of England) 8 Ounces, I. demand how much it will weigh when the Peck is worth 1 s. 6 d. according to the same Rate or Proportion ? Anf. 10 02. 23 9. w. Ber.

Having

Having placed and reduced the given Numbers according to the 6th and 9th Rules of the 10th Chapter, I confider that at 1 s 6 d. per Peck ; the Penny loaf will weigh more than 2 s. Fer Peck; for as the Price decreafeth, fo the the Weight increaseth; and as the Price increaseth, fo the Weight diminishes; wherefore because the first Term requires more than the fecond, the leffer Extream must be the Divisor, viz. 1 s. 6 d. or 8 d. and having finished the Work, I find the Answer to be 10 oz. 13 p. w. 8 gr. Wheat is worth I s 6 d. according to the given Rate of 8 Ounces, when the peck is worth two Shillings. The Work is plain in the following Operation.

> 62. d. If 24 8 18 . oz. p. w. gr. 18) 192 (10 13 8 Anf. 18 12 22 P. W. 240 (13 18 60 54 (6) 144 (8 gr.

Quest. 2. How many Pieces of Money or Merchandize at 20 s. per Piece, are to be given or received for 240 Pieces, the Value or Price of every Piece being 12 Shillings? Answer 144 Pieces. For if 12 s. required 240 Pieces, then 20 s. will require less; therefore the bigger Extream must be the Divisor, which is the third Number, &c. See the Work as in the Margin.

Queft. 4. How many Yards of 3 Quarters Broad are required to Double, or be equal in Measure to 30 Yards, that are 5 Quarters Broad? Answer, 50 Yards. For fay, if 5 Quarters will require 30 Yards long, what Length will 3 Quarters Broad Here I confider that require ? 3 Quarters Broad will require more Yards than 30; for the narrower the Cloth is, the more

grs. long 30 3) 250 (50 yds 15 (0)

in Length will go to make equal Measure with a broader Piece.

Queft. 5. At the Request of a Friend, I lent him 300 %. for 12 Months; promifing to do me the like Courtefy at my Necessity; but when I came to request it of him, he could let me have but 150 l. now I defire to know how long I may keep this Money to my prenary Satisfaction for my former Kindness to my Friend; Answer. 16 Months, I fay, if 200 1. will require more Time than 12 Months, therefore the leffer Extream, viz 150, must be the Divifor; multiply and divide, and you will find the 4th inverted Proportionable to be 16, and fo many Months I ought to keep the 150 1. for Satisfaction.

Queft. 6. If for 24 s. I have 1200 l. Weight carried 36 Miles, how many Miles shall 1800 1. be carried for the Quelt.

fame? Anf. 24 Miles.

Queft. 7. If for 24 s. I have 1200 wt. carried 26 Miles. how many lb. wt. fhall I have carried 24 Miles for the fame Money? Anf. 1800 lb. wt.

Queft. 8. If 100 Workmen in 12 Days finish a Piece of Work or Service, how many Workmen are fufficient to do

the fame in 3 Days? Anf. 400 Workmen.

Queft. o. A Colonel is besieged in a Town, in which are 1000 Soldiers, with Provision of Victuals only for three Months; the Question is. How many of his Soldiers must he difmifs, that his Victuals may last the remaining Soldiers 6 Months? Anf. 500 he must keep, and difmis as many.

Queft. 10. If 201. worth of Wine is fufficient for the Ordinary of 100 Men, when the Tun is fold for 100 1. how many Men will the same 20%, worth suffice when the Tun is

worth 25 1. Anf. 125 Men.

Queft. 11. How much Plush is sufficient for the Cloak. which hath in it 4 Yards of 7 Quarters wide, when the Plush is but 3 Quarters wide? Anf. of Yards of Plush.

Queft. 12. How many Yards of Canvas that is Ell wide will be sufficient to line 20 Yards of Say, that is 2 Quarters

wide? Anf. 12 Yards.

Quest. 13. How many Yards of Matting that is 2 Feet wide will cover a Floor that is 24 Feet long, and 20 Feet

broad? Anf. 140 Feet.

Queft. 14. A Regiment of Soldiers, confifting of 1000. and to have new Coats, and each Coat to contain two Yards two Quarters of Cloth that is 5 Quarters wide, and they are to be lined with Shalloon that is 2 Quarters wide, I demand how many Yards of Shalloon will line them? Anf. 16666 } Quarters, or 4166 1 Yards.

Quest. 15. A Messenger makes a Journey in 24 Days, when the day is 12 Hours long: I defire to know in how many days he will go the same when the Day is 16 Hours

long? Anf. in 18 days.

Queft. 16. I borrowed of my Friend 60 1. for 8 Months, and de hath Occasion another Time to borrow of me for 12 Months. I defire to know how much I must lend to make good his former Kindness to me? Ans. 42 1. 13 s. 4. The general Effect of the Rule of Three Inverse, is contained in the Definition of the same, that is, to find a fourth Term in Reciprocal Proportion inverted to the Pro-

portion give.

The 2d Effect is, by two Pieces, or Value of two several Pieces of Money or Merchandize known, to find how many pieces of the one price is to be given for so many of the other. And so to reduce and exchange one Sort of Money or Merchandize into another. Or else to find the price unknown of any piece given to exchange in reciprocal Proportion.

The 3d Effect is, by two different Prices of a Measure of Wheat bought or fold, and the weight of a Loaf of Bread, made answerable to one of the Prices of the Measure given, to find out the Weight of the same Loaf answerable to the Weight of the same Loaf answerable to the same Loa

swerable to the other Price of the faid Measure given.

Or elfe, by the two several Weights of the same priced Loaf, and the Price of the Measure of Wheat answerable to one of those Weights given, to find out the other Price of the Measure answerable to the other Weight of the same Loaf.

The 4th Effect is, by two Lengths, and one Breadth of two Rectangular Places known, to find out another Breadth unknown. Or, by 2 Breaths, and one Length given, to find out another Length unknown in an inverted Propor-

tion.

The 5th Effect is, by double Time, and a capital Sum of Money borrowed or lent to find our another capital Sum answerable to one of the given Times; or otherwise by two capital Sums, and a Time answerable to one of them given, to find our a Time answerable to the other

capital Sum in reciprocal Reason.

The 6th Effect is, by two different Weights of Carriage, and the Distance of the Place in Miles or Leagues given, to find another Distance in Miles answerable to the same Price of Payment. Or otherwise, by two Distances in Miles, and the Weight answerable to one of the Distances in Miles, (carried for a certain Price) to find out the Weight answerable to the other Distance for the same Price.

The 7th Effect is by double Workmen, and the Time answer-

answerable to one of the Numbers of Workmen given, to find out the Time answerable to the other Number of Workmen in the Performance of any Work or Service. Or contrariwise, by double Time, and the Workmen answerable to one of those Times given, to find out the Number of Workmen answerable to the other Time, in the

Performance of any Work or Service.

Also by a double Price of Provision, and the Number of Men, or other Creatures, neurished for a certain Time answerable to one of the Prices of Provisions given, to find out another Number of Men or other Creatures answerable to the other Price of the Provision for the same Time. Or contrariwise, by two Numbers of Men, or other Creatures nourished, and one Price of Provision answerable to one of the Numbers of Creatures given, to find out the other Price of the same Provision answerable to the other Number of Creatures, both being supposed to be nourished for the same, &c.

To prove the Operation of the Rule of Three Inverte, multiply the 3d and 4th Terms together, and note their Product; and multiply the 1st and 2d together, and if their Product is equal to the product of the 3d and 4th, then is the Work truly wrought, but if it falleth out otherwise, then it

is erroneous.

As in the first Question of this Chapter 16 (the third Number) being multiplied by 6 (the 4th Number) the Product is 96, and the Product of 8 (the first Nuerber) multiplied by 12 (the 2d Number) is 96, equal to the first Pro-

duct, which proves the Work to be right.

And note, That if in Division any Thing remain, such Remainder must be added to the Product on the third and sourth Terms, and if the Sum be equal to the Product of the first and second (the Homogeneral Terms being of one Denomination) the Work is right.

# CHAP. XII. The Double Rule of Three Direct.

WE have already delivered the Rule of Single Proportion, and we come now to lay down the Rules of Plur Proportion.

1, Plural

r. Plural proportion is, when more Operations in the Rule of Three than one are required before a Solution can be given to the Question propounded therefore in Questions that require Plurality in Proportion, there are always given more than three Numbers.

2. When there are given five Numbers, and a fixth is required in Proportion thereunto, then the fixth Proportion is faid to be found out by the Double Rule of Three, as in

the Question following, viz.

If 1001. in 12 Months gain 61. Interest, how much will

75 1. gain in o Months?

3. Questions in the Double Rule of Three, may be refolved either by 2 Single Rules of Three, or by 1 Single Rule of Three, compounded of the five given Numbers.

4. The Double Rule of Three, is either Direct or elfe

Inverse.

5. The Double Rule of Three Direct is, when in 5 given Numbers, a 6th Proportionable may be found out by

two Single Rules of Three Direct.

6. The five given Numbers in the Double Rule of Three Direct confisteth of two Parts, viz. 1. A Supposition, and 2dly, of a Demand; the Supposition is contained in the three first of the five given Numbers, and the Demand lies in the two last; as in the Example of the second Rule of this Chapter, viz. If 1001. in 12 Months gain 61. Interest, what will 751. gain in 9 Months? Here the Supposition is expressed in 100, 12, and 6, for it is said if 1001. in 12 Months gain 61. Interest: and the Demand lieth in 75 and 9, for it is demanded, How much 751. will gain in 9 Months.

7. When your Question is stated, the next Thing will be to dispose of the given Numbers in due Order and Place as a Preparative for Resolution: Which that you may do, First, Observe which of the given Numbers in the Supposition is of the same Denomination with the Number required, for that must be the 2d Number, in the first Operation, of the Single Rule of Three, and one of the other Numbers in the Supposition, it matters not which, must be the first Number, and that Number in the Demand, which is of the same Denomination with the first, must be the third Number; which three Numbers being thus laced.

placed will make one perfect Question in the Single Rule of Three, as in the forementioned Example: First, I consider, that the Number required in the Question, is in the Interest of Gain of 75 l. therefore that Number in the Supposition which hath the same Name, viz.

6 l. which is the Interest or Gain of 100 l.

must be the second Number in the first Operation, and either 100 or 12, it matters not which, must be the first Number; but I will take 100; and then for the third Number, I put that Number in the demand, which hath the same demonination with 100, which is 75; for they both signify Pounds Principal, and then the Numbers will stand as you see in the Margin.

But if I had for the first Number put the other Number in the Supposition, viz. 12, which fignifies 12 Months, then the third Number must have been 9, which is the Number in the demand which hath the same denomination with the first, viz 9 Months, and they

will stand as in the Margin.

There yet remain two Numbers to be disposed of, and

those are one in the Supposition, and another in the demand; that which is of the Supposition I place under the first of the Or this three Numbers; and the other which is the demand, I place under the third Number; and then two of the Terms in the Supposition will stand, one over the other, in the first Place,

and the two Terms in the demand will stand, one over the other, in the third Place, as in the Margin.

8. Having disposed or ordered the given Numbers, according to the last Rule, we may proceed to a Resolution; and first I work with the three uppermost Numbers, which according to the first disposition, are 100, 6, and 75; which is as much as to say, if 100 l. requires 6 l. Interest, how much will 75 Pounds require? which by the 3d Rule of the 11th Chapter I find to be direct; and by the 7th and 8thRule of the 10th Chapter, I find the 4th Proportional Number to be 4 l. 101 fo that by the foregoing single Question, I have discovered how much Interest 75 l. will gain in 12 Months: the Operation whereof solloweth on the lest Hand under the Letter A, and having

discovered how much it will gain in 12 Months, we may by another Question easily discover how much it will gain in 9 Months; for this 4th Number (thus found) I put in the Middle between the lowest Numbers of the 5, after they are placed according to the 7th Rule of this Chapter; and then it will be a second Number, in another Question

in the Rule of Three. The Numbers being 12 4 10 9 the first and third Numbers being of one Denomination, viz. both Months, and may be thus expressed, If 12 Months require 4 l. 10 s. Interest, what will 9 Months require? And by the 3d Rule of the 11th Chapter, I find it to be the direct Rule, and by working according to the Directions laid down in the 7th, 8th, and 9th Rules of the 10th Chapter, I find the fourth Proportional Number to the last Single Question, to be 3 l. 7 s: 6 d. which is the fixth proportional Number to the 5 given Numbers, and is the Answer to the general Question. The Work of the last Single Question is expressed on the right Side of the Page under the Letter B. as followeth:

100 12 Then fay, 75 75 If 12 4 20 go Shil 12 1 00) 4 50 (4-10 180 90 1080 Pence 12) zlo l. s. d. Rem. (50) 12)9720 (810(67 (67 (3 7 6 Mull. 20 1,00) 10,00 (10 1. 99 12 12 (0) (6) d. Fa. 31. 75. 6d.

So that by the foregoing Operation I conclude, that if 200 l. in 12 Months gain 6 l. Interest. 75 l. will gain 3 l. 7 s. 6 d. in 9 Months, after the same Rate.

The Answer would have been the same if 12 6 9 the 5 given Numbers had been ordered actorous to the second Method, viz. as you see in the Margin.

For first, I say, if 12 Months gain 6 l what will 9 Months gain? This Question I find to be Direct, by the 3d Rule of the 11th Chapter, and by the 7th and 8th Rules of the 10th Chapter, I find the 4th proportional

Number to thefe three to be 41. 10 s.

Thus have I found out what is the Interest of 100 l. for 9 Months, and I am now to find the Interest of 75 l. for 9 Months, to effect which, I make this 4th Number (found as before) to be my second Number in the next Question, I say, if 100 l. require 4 l. 10 s. what will 75 l. require? This Question I find (by the said 3d Rule of the 11th Chapter) to be Direct, and by the said 7th, 8th, and 9th Rules of the 10th Chapter, I find the Answer to be as before, viz. 3 l. 7 s. 6 d.

The Operation of this Rule in the following Questions,

are purposely omitted, to try the Learners Capacity.

Quest, 3. A 2. Example in this Rule may be as followeth, viz. A Carrier received 42 Shillings for the Carriage of 300 Weight 150 Miles, I demand how much he ought to receive for the Carriage of 7 C. 3 qrs. 4 lb. 50 Miles at that Rate? Ans. 36 s. 9 d.

Queft. 3. A Regiment of 136 Soldiers eat up 351 Quarters of Wheat in 108 Days, I demand how many Quarters of Wheat 11232 Soldiers will eat in 56 Days at that Rare;

Anf. 1404 Quarters.

Quef. 4 If 40 Acres of Grass be mowed by 24 Men in

28 Days ? Anf. 480.

Quest. 5. If 48 Bushels of Corn (or other Seed) yield 376 Bushels in a Year, how much will 240 Bushels yield in 6 Years at that Rate? That is to say, if they were sowed 240 Bushels every one of the 6 Years? Ans. 17280 Bushels.

Queft.

Days, what will be the Wages of 32 Men for 24 Days?

Quest. 7. It 14 Horses eat 46 Bulhels of Provender in 16 Days, how many Bushels will 24 Horses eat in 24.

Days? Anf. 120 Bushels.

Quest. 8. If 8 Cannons in one Day spend 48 Barrels of Powder, I demand how many Barrels 24 Cannons will

fpend in 22 Days at that Rate? Auf. 1728 Barrels.

Quest. 9. If a Family confisting of 7 Persons, there are drank out 2 Kilderkins of Beer in 12 Days, how many Kilderkins will there be drank our in 8 Days, by another Family confisting of 14 Persons? Answer. 48 Gallons, or 2 Kilderkins and 12 Gallons.

Quest. 10. An Usurer put 75 l. out, to receive Interest for the same, and when it had continued 9 Months, he received for Principal and Interest 78 l. 7 s. 6 d. I demand at what Rate per Cent. per Annum, he received Interest?

Ans. 6 l. per Cent. per Annum.

## CHAP. XIII.

# The Double Rule of Three Inverse.

THE Double Rule of Three Inverse is, when a Question in the Double Rule of Three is resolved by two Single Rules of Three, and one of those Single Rules falls out to be Inverse, or requires a sourth Number in Proportion reciprocal, for both Questions are never Inverse.

2. In all Questions of the Double Rule of Three, as well Inverse as Direct, you are in the Disposing of the 5. given Numbers, to observe the 7th Rule of the 12th Chapter, and in resolving of it by two Single Rules, observe to make Choice of your Numbers for the first and single Questions, according to the Directions given in the 8th Rule of the same Chapter, and in the Example following, viz.

Queft. 1. If 100 l. Principal in 12 Months gain 61. Interest, what Principal will gain 21. 7 s. 6d. in 9

Months ?

2

ue-

61.

This

This Question is an Inversion of the first Question of the 12th Chapter, and may serve for a Proof thereof.

In order to a Resolution, I dispose of the 5 given Numbers, according to the 9th Rule of the last Chapter; and being so dispose, they will stand as followeth.

12 100 9 1. s. d.
6 0rthus,
1. s. d.
6 100 3 7 6

(0)

Here observe, That according to the 8th Rule of the 12 Chapter, the first Queftion, if you take it from the 5 Numbers, as they are ordered or placed first, will be, if 12 Months require 100 %. Principal, what will o Months require to make the same Interest? This, according to the 3d Rule of the 12th Chapter, is inverte, and the Answer will be found, by the 2d Rule of the rith Chapter, to be 1331. 6 s. 8 d. The 2d Quethion then will be, If 61. Intereft require 1331. 6s. 8d. Principal; how much Principal will 3 1. 7 s. 6 d. require? This is a direct Rule, and the Answer in a direct Proportion, 75 1. See the Work.

Or thus,	. 3	,		
1		d.		
0 3	7 6			
Field	I fay,			
m I	m			
	9			
12				
	1.	s.	d.	
9) 1200	(133	6	8	
9		1.	s. ·	d.
	Faci	t 133	6	8
30				
27				
27				
(3)		da Si		
20		nica i	1	
9) 60 (6	S.			
54				
(6)				
9) 72 (8	d.			7.7

1. If 6 250	1, 133 20	Then is.	fay, d. 8	1. 3 20	s. 7	d. 6
1440d.	2666 12			67 12		
	5340 2666		6	40		
	32000 810		8	10 d.		
	320000 256					
244(0)	2592000	-24°	000 4	d. or	75 1.	
	144	16	8			

So that by the foregoing Work I find, that if 6 l. Interest be gained by 100 l. in 12 Months, 3 l. 17 s. 6d. will be gained by 75. in 9 Months

120

120

(0)

1152

1152

(0)

But if the Resolution had been sound out by the Number as they are ranked in the 2d place, then the second Question in the Single Rule would have been Inverse, and the first Question Direct, and the Conclusion the same with the first Method. viz. 75 l.

Quef. 2. If a Regiment confisting of 939 Soldiers, can eat up 351 Quarters of Wheat in 168 Days, how many Soldiers will eat up 1464 Quarters in 56 Days at that Rate? Ans. 11232 Soldiers.

Quel. 3. If 12 Students in 8 Weeks spend 48 l. I demand how many Students will spend 288 l. in 18 Weeks?

Quep.

Queft. 4. If 48 l. ferve 12 Students 8 Weeks, how many Weeks will 281 l. ferve 4 Students? Anf. 144 Weeks.

Quest. 5. If when a Bushel of Wheat cost 3 s. 4 d. the Penny-loaf weigheth 12 Ounces, I demand the Weight of the Loaf worth 9 d. when the Bashel cost 10 s. 4 of. 36 Ounces.

Quest. 6. If 48 Pioneers in 12 Days cast a French 24 Yards long, how many Pioneers will cast a Trench 168 yes. long in 16 Days? Anst. 252 Pioneers.

Quest. 7. If 12 C. weight being carried 100 Miles, cost 5 l. 11 s. I desire to know how many C. weight may be carried 150 Miles for 12 l. 12 s. at that Rate? Ans. 18 C.

Quest. 8. If when Wine is worth 30 l. per Tun, 20 l. worth is sufficient for the Ordinary of 100 Men, how many Men will 4 l. worth suffice, when it is worth 24 l. per Tun? Ans. 25 Men.

Queft. 9. If 6 Men in 24 Days mow 72 Acres; in how many Days, will 8 Men mow 24 Acres? Anf. in 6 Days.

Queft. 10. If when the Tun of Wine is worth 30 1. 100 ...
Men will be fatisfied with 201. worth, I defire to know what the Tun is worth, when 41. worth will fatisfy 25
Men at the fame Rate? Ant. 24 1. per Tun.

#### CHAP. XIV.

## The Rule of Three composed of Fivo Numbers.

THE Rule of Three composed, is when Questions (wherein there are 5 Numbers given to find a 6th in Proportion thereunto) are resolved by one Single Rule of Three composed of the 5 given Numbers.

2. When Questions may be performed by the Double Rule of Three Direct, and it is required to resolve them by the Rule of Three composed; first order or rank your Numbers according to the 7th Rule of the 12th Chap, then

Multiply the Terms or Numbers (that stand one over the other in the first Place) the one by the other, and make their Product the first Term in the Rule of Three Direct; then multiply the Terms that stand one over the other in the third Place, and place their Product for the

3d Term in the Rule of Three Direct, and put the middle Term of the uppermost for a second Term; then having found a 4th Proportion Direct to these Three, this 4th proportional so sound shall be the Answer required.

So the first Question of the 12th Chapter being proposed, wiz. If 100 l. in 12 Months gain 6 l. Interest, what will 75 l. gain in 9 Months? The Numbers being ranked (or

placed) as is there directed and done.

Then I multiply the two First Terms, 100 and 12 the one by the other, and their product is 1200 for the first Term; then I multiply the two less Terms 75 and 9 together and their product is 675 for the first Term. Then I say, as 1200 is to 6, so is 675 to the Answer, which by the Rule of Three Direct, will be found to be 31. 7 s. 6 d. as was before found.

3. But if the Question be answered by the Double Rules of Three Inverse, then (having plac'd the five given Terms as before) multiply the lowermost Term of the first Place. by the uppermost Term of the third place, and put the product for the first Term; then multiply the uppermost Term of the first place, by the lowermost Term of the third place, and put the product for the third Term, and the second Term of the three highest Numbers for the middle Term to those two; then if the Inverse proportion is found in the uppermost three Numbers, the sourch proportional Direct to these three shall be the Answer. So the first Question to the 13th Chapter beidg stated, viz. If 100 l. principal in 12 Months gain 6 l. It terest, what principal will gain 3 l. 7 s. 6 d. in 9 Months? State the Number as there directed in the first Order, viz.

m. l. m.
12 100 0
1. s. d.
2 7 5

Then reduce the 61 and 31. 7 s. 6d. into Pence, and the 61 is 1440d. and 31. 7 s. 6d. is 810 d. then multiply 1440 by 9, the Product is 12960 for the first Term in the Rule of Three Direct, and multiply 810 by 12, the Product is 1720 for the third Term; then I say, as 12960 is to 130 l. so is 9720 to the Aniwer, viz. 75 l. as before. But if the Terms had been placed after the second Order, viz.

Then the Inverse Proportion is found in the lowest Numbers, and having composed the Numbers for a single Rule of Three, as in the second Rule foregoing; then the Answer must be found by a single Rule of Three Inverse; for here it falls out to multiply 810 by 12 for the first Number, 1440 by 9 for the third Number; and then you must say, As 9720 is 100 l. so is 12960 to the Answer, which by Inverse Proportion will be sound to be 75 l. as before.

The Question in the 12th and 13th Chapters may serve

for thy farther Experience.

#### CHAP. XV.

## Single Fellowship.

Ellowship is that Rule of Plural Proportion, whereby we ballance Accounts depending between diverse Persons, having put together a general Stock, so that they may every Man have his proportional Part of Gain, or sultain his proportional Part of Loss.

2. The Rule of Fellowship is either Single, or it is

Double.

.

he

40

ie

is

1.

if

iz.

1.

3. The Single Rule is when the Stocks propounded are Single Numbers, without any Respect or Relation to Time, each Partner continuing his Money in Stock for the same Time.

4. In the Single Rule of rellowship, the Proportion is, as the whole Stock of all the Partners is in Proportion to the total Gain or Loss, so is each Man's particular Share to the Stock, to his particular Share in the Gain or Loss. Therefore take the Total of all the Stocks for the first Term in the Rule of Three, and the whole Gain or Loss for the second Term, and the particular Stock of any one of the Partners for the third serm; then multiply and divide according to the seventh Rule of the 9th Chapter, and the fourth proportional Number is the particular Loss or Gain of him whose Stock you made your

3d Term in the Rule of Three Direct, and put the middle Term of the uppermost for a second Term; then having found a 4th Proportion Direct to these Three, this 4th proportional so found shall be the Answer required.

So the first Question of the 12th Chapter being proposed, viz. If 100 l. in 12 Months gain 6 l. Interest, what will 75 l. gain in 9 Months? The Numbers being ranked (or

placed) as is there directed and done.

Then I multiply the two First Terms, 100 and 112 the one by the other, and their product is 1200 for the first Term; then I multiply the two less Terms 75 and 9 together and their product is 675 for the first Term. Then I say, as 1200 is to 6, so is 675 to the Answer, which by the Rule of Three Direct, will be found to be 3 l. 7 s. 6 d. as was before found.

3. But if the Question be answered by the Double Rules of Three Inverse, then (having plac'd the five given Terms as before) multiply the lowermost Term of the first Place. by the uppermost Term of the third place, and put the product for the first Term; then multiply the uppermost Term of the first place, by the lowermost Term of the third place, and put the product for the third Term, and the second Term of the three highest Numbers for the middle Term to those two; then if the Inverse proportion is found in the uppermost three Numbers, the sourch proportional Direct to these three shall be the Answer. So the first Question to the 13th Chapter beidg stated, viz. If 100 l. principal in 12 Months gain 6 l. It terest, what principal will gain 3 l. 7 s. 6 d. in 9 Months? State the Number as there directed in the first Order, viz.

m. l. m.
12 100 9
1. s. d.

Then reduce the 61 and 31. 7 s. 6d. into Pence, and the 61 is 1440d. and 31. 7 s. 6d. is 810 d. then multiply 1440 by 9, the Product is 12960 for the first Term in the Rule of Three Direct, and multiply 810 by 12, the Product is 1720 for the third Term; then I say, as 12960 is to 130 l. so is 9720 to the Aniwer, viz. 75 l. as before. But if the Terms had been placed after the second Order, viz.

Then the Inverse Proportion is sound in the lowest Numbers, and having composed the Numbers for a single Rule of Three, as in the second Rule foregoing; then the Answer must be sound by a single Rule of Three Inverse; for here it falls out to multiply 810 by 12 for the first Number, 1440 by 9 for the third Number; and then you must say, As 9720 is 100 l. so is 12960 to the Answer, which by Inverse Proportion will be sound to be 75 l. as before.

The Question in the 12th and 13th Chapters may serve

for thy farther Experience.

#### CHAP. XV.

# Single Fellowship.

Ellowship is that Rule of Plural Proportion, whereby we ballance Accounts depending between diverse Persons, having put together a general Stock, so that they may every Man have his proportional Part of Gain, or suftain his proportional Part of Loss.

2. The Rule of Fellowship is either Single, or it is

Double.

e o e is l. f

5.

3. The Single Rule is when the Stocks propounded are Single Numbers, without any Respect or Relation to Time, each Partner continuing his Money in Stock for the same Time.

4. In the Single Rule of cellowship, the Proportion is, as the whole Stock of all the Partners is in Proportion to the total Gain or Lofs, so is each Man's particular Share to the Stock, to his particular Share in the Gain or Lofs. Therefore take the Total of all the Stocks for the first Term in the Rule of Three, and the whole Gain or Lofs for the second Term, and the particular Stock of any one of the Partners for the third Term; then multiply and divide according to the seventh Rule of the 9th Chapter, and the fourth proportional Number is the particular Lois or Gain of him whose Stock you made your

often as there are particular Stocks or Partners in the Question, and the fourth Terms produced upon the several Operations are the respective Gain or Loss of whose particular Stock given, as in the Example following.

Quest. 1. Two Persons, viz. A and B bought a Ton of Wine for 20 l. of which A paid 12 l. and B paid 8 l. and they gained in the Sale thereof 5 l. now I demand each

Man's Share in the Gains, according to his Stock.

First, I find the Sum of all their Stocks, by adding them together, viz. 12 l. and 8 l. which are 20 l. then according to this Rule, I say first, if 20 l. (the 12 Sum of their Stocks) require 5 l. the total Gain, 8 how much will 12 l. (the Stock of A) require?

Multiply and divide by the 7th Rule of the 20 l. oth Chapter, and the Answer is 3 l. for the Share of A in the Gains; then again I say, if 20 l. require 5 l. what will 8 l. require? The Answer is 2 l. which is the Gain of B, so I conclude on the Share of A to the Gain is 3 l. and the Share of B in the Gain is 2 l. which in all is 5 l.

24) 40 (21:

Apon a joint Adventure, A put into the common Stock 781 B put 1171. and C put in 2341. and they find when they make up their Accompts) that they have gained in all 2541. now I defire to know each Man's particulare Share in the Gain.

First, I add their particular Stocks together, and their Sum is 429 L then say, If 429 L gain 264 L what will 78 L gain; and what will 234 (the Stocks of A, B, and C) gain? Work by three several Rules of Three, and you will find that.

78 117 234

Sum 429

The Gain of \{ \begin{aligned} \begin{aligned}

Sum 264

Quest. 3. Four Partners, viz. A, B, C, and D, amongst them built a Ship, which cost 1730 L of which A paid 3461. B 519 L. C 692 L and D 173, and her Freight for a certain Voyage is 370 L which is due to the Owners or Builders. I demand each Man's Share therein according to his Charge in Building her.

Answer, A 74 B 111 C 148 D 37

Quest. 4. A. B., and C enter into Partmerthip for a cartain I ime. A put into a common Stock 364 l. B put in 482 l. C put in 500 l. and they gained 867 l. Now 1 demand each Man's Share in the Gain, proportionable to his Stock? Ass. 1. s. d.

Sum 867 00 0

5. To prove the Single Rule of Fellowship add each Man's particular Gain or Loss together, [The Proof of the Rule of single Fellowship] and if the total Sum is equal to the general Gain or Loss, then is the Work rightly performed; but otherwise it is erroneous. Example, In the first Question of this Chapter, the Answer was, That the Gain of A was 3 L and the Gain of B 2 L which added together, makes 5 L equal to the total Gain given.

G 1

If in finding out the particular Shares of the fevera Partners, any Thing remain after Division is ended, such Remainders must be a ded together (they being all Fractions of the same Denomination) and their Sum divided by the common Divisor in each Question, viz. The total Stock, and the Quotient added to the particular Gains, and then if the total Sum is equal to the particular, the Work is right, otherwise not.

As in the 4th Question, the Remainder were 354, 62, and 930, which added together make 1346, which divided by 1346 (the Sum of their Stocks) the Quotient is 1 d. which I add to the Pence, &c. and the Sum of their Share is 8971. equal to the total Gain, wherefore I con-

clude the Work is right.

## C H A P. XVI.

## Double Fellowship.

Double Fellowship, is when several Persons enter into Partnership for unequal Time; that is, when every Man's particular Stock hath Relation to a particular Time.

particular Stock by its respective Time, and having added the several Products together, make their Sum the first Number or Term in the Rule of Three, and the total Gain or Loss the second Number, and the Product of any one's particular Stock by his Time, the third Term, and the fourth Number in Proportion thereunto is his particular Gain or Loss, whose Product of Stock and Time is your third Number.

Then repeat, (as in Single Fellowship) the Rule of Three as often as there are Products (or Partners) and the four

Terms thereby invented, are the Numbers required.

Example.

Quest. 1. A and B enter into Partnership; A put in 401.

for 6 Months, B put in 75 1. for 4 Months, and they gained 90 1. now I demand each Man's Share in the Gain, proportional to his Stock and Time? Answer. A 20 1 B 50 1.

Chap. 16. Double Fellowship. 127	7
To refolve this Question; I first multiply the Stock of A (viz. 40 l.) by its Time (3 Months)	f
and the Product is 120; then I multiply 1.	
the Stock of B by its Time, viz. 751. by 40 7!	5
	4
the Product of A, his Stock and Time, and the Sum is 420. Then by the Rule A 120 B 300	-
of Three Direct I say, as 420 (the Sum	
of the Product) is to 70 (the total Gain)	
fo is 120 (the Product of A his Stock Sum 420	9
and Time) to 20 l. (the Share of A in	
the Gains.) Then I say again, as 420 is to 70, so is 30, the Product of B his Stock and Time, to 50 l. (the Shar	0
of B in the Gains,) and that each is to have for his Shire.	
Queft. 2. A. B. and C. make a Stock for 12 Months	
A put in at first 364 l. and 4 Months after that he put it	n.
401. B put in at first 4081. and at the End of the 7 Months h	=
took out 86 l. C put in at first 148 l. and 3 Months after he put in 86 l. more, and 5 Months after that he put in	
100 l. more, and at the End of 12 Months their Gain i	8
found to he 14361. I defire to know each Man's Share in	n.
the Gains, a cording to his Stock and Time.	
First, I consider that the whole Time of their Patter	
Products, or Stock and Time as followeth.	
A had at first 3644. for 4 Mosths, wherefore	
that Product, is 145	6
Then he put in 40 l, which with the firth Sum.	
makes 404 l. which cominged the Remainder of the Time, viz. 8 Manths, and that product it 323	
The Sum of the products of the Stock and Time	
The Sum of the products of the Stock and Time	8
music led down in the car hallowed to rest Chief	
Bhad 408 1. in 7 Months, whose product is 285	6
And then took out 86 is therefore he lete in	
win 5 Months, whose product is a sale of the 161	•
The Sum of the products of the Stock atd	
Time of B is 446	6
C put in 1481. for 3 Months, whose product -	-
being multiplied by 3, is G. 4. The	4
The line	-

1 1 2

Then he put in 86 l. which, added to the first (viz. 148 l.) makes 234 l. which lay in Stock 5 Months, and their Product is— Then he put in 100 l. more, so then he had in Stock 334 l. which continued the Remainder of the Time, 4 Months, which multiplied together,	.,
The Sum of the Product of the Money and Time of Cis	2950
B C	4456

The total Sum of all the Product 12104.

Then I fay, as 12104 is to 1426 (the total Gain) fo is 4688 to the Share of A in the total Gain, &c. go on as in the foregoing Examples, and you will find their Shares in the Gain to be as followeth, vis.

The Share of \{ B \\ C \} is \{ 556 \quad \text{og} \quad \frac{61\frac{12\frac{1}{24}\frac{1}{24}}{520} \quad \text{16} \quad \frac{12\frac{1}{24}\frac{1}{24}}{349} \quad \text{19} \quad \text{8}\_{7.9}\frac{12\frac{1}{24}\frac{1}{24}}{12\frac{1}{24}}

2008. 3. These Grafiers, A, B, and C, take a Piece of Ground for 46 & 10 s. in which A put 12 Oxen for 8 Months, B put in 16 Oxen for 5 Months, and C put in 18 Oxen for 4 Months; now the Question is, what each Man shall pay of the 46 s. 10 s. for his Share in that Charge.

The Proof of this Rule is the same with that of Single Fellowship, laid down in the 5th Rule of the 15th Chapter;

and note, that

If a Loss be sustained instead of a Gain among Partners, every Man's Share to be borne in the Loss, is to be found after the same Method as their Gain, whether their Stocks be for equal or unequal Time.

## CHAP. XVII.

# Allegation Medial.

THE Rule of Alligation is that Rule in Plural Proportion by which we resolve Questions, wherein is a Composition or Mixture of diverse Simples, as also it is useful in Composition of Medicines, both for Quantity, Quality, or Price: and its species are two, viz. Medial and Alternate.

2. Alligation Medial, is, when having the feveral Quantities and Prices of feveral Simples propounded, we discover the mean Price or Rate of any Quantity of the Mixture compounded of those Simples, and the Proportion is.

As the Sum of the simples to be mingled is to the total Value of all the simples, so is any Part or Quantity of the Composition or Mixture to its mean Rate or Price.

Queft. 1. A Farmer mingled 20 Bustels of Wheat at 5 s. per Bustel, and 36 Bushels of Rye at 3 s. per Bushel, with 40 Bushels of Barley at 2 s. per Bushel, now I defire to know what one Bushel of that Mixture is worth?

To resolve this Question, add together the given Quantities, and their Value, which is 90 Bushels, whose total Value is 141. 8 s. as appeareth by the Work sollowing.

For, Bu	fiels .	7
The Sum of	20 of Wheat, as 5 s. per Bushel, is 36 of Rye, as 3 s. per Bushel, is 40 of Barley, at 2 s. per Bushel, is	5 8 4 0
	2 of, and their Value is.	14.8

Then fay, by the Rule of Three Direct, if 96 Bushels cost, or is worth 144. 8 a what is one Bushel worth?

Bufb. 1. s. Bufb.
96 14 8 t
20
96) 288 (3 s.

o Facit 3 s. ger Bufhel.

Quest. 2. A Vintner mingled 15 Gallons of Canary at 32. per Gallon, with 20 Gallons of Malaga, at 75. and 6d. per Gallon, with 10 Gallons of Malaga, at 65. 8 d. per Gallon, and 25 Gallons of White wine at 45. per Gallon. Now I demand what a Gallon of this Mixture it worth? Work as in the last Question, and you will find the Answer to be 65. 2 d. 2 grs. \$\frac{1}{2}\$.

ger C. with 3 C. of Sugar at 3 l. 14 s. 8 d. per C. and with 8 C. at 1 l. 17 s. 4 d. per C. I desire to know the Price of a

C. wt. of that Mixture?

Anf. 2 l. 13 s. 1 d. 7?.

3. The Proof of the Operation, is by the Price of any Quantity of the Mixture, to find out the total Value of the whole Composition, and if it is equal to the total Value of the several Simples, the Work is right, otherwise not. (The Proof of Allegation Medial.) As in the first Example, the Answer to the Question was that 3 s. is the Price of 1 Bushel; wherefore I say, by the Rule of Proportion, if 1 Bushel be 3 s. what is 96 Bushels? Answer 14 l. 18 s. which is the total Value of the several Simples: Wherefore the Work is right.

#### CHAP. XVIII.

# Allegation Alternate.

P: A Lligation Alternate is, when there are given the particular Prices of feveral Simples, and thereby we discover such Quantities of those Simples, as being mingled together, shall bear a certain Rate propounded.

2. When such a Question is stated, place the given Prices of the Simple one over the other, and the propounded Price of the Composition against them in such Sort, that it may represent a Root, and they as so many Branches springing from it, as in the following Example.

One fi. c. A dermin Farmer is defired to mix 20 Bushels of Wheat at 5 s. or 60 d. per Bushel, with Rye at 3 s. or 136 d. per Bushel, and Oats at 1 s. 6 d. per Bushel, and defireth to mix such a Quantity of Rye, Barley, and Oats, with the 20 Bushels of Wheat, as that the whole Composition may be worth 2 s. 8 d. or 22 d. per Bushel.

The Prices of the Simples being placed according to the last Rule (with the Price of the Composition progranded

as a Root to them) will stand as followeth.

3. Having thus placed the given Numbers, you are to link the feveral Rates of the Simples one to the other, by certain Arches, in such Sort, that one that is leffer than the mean Rate, may be coupled to another that is greater than the mean Rate; so the Question last propounded will stand.

 $3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \end{cases} \qquad 3^{2} \begin{cases} 60 \\ 24 \\ 18 \end{cases} \qquad 3^{2} \end{cases} \qquad$ 

4. Then take the Difference between the Rost and the feveral Branches, and place the Difference of each against the Number or Branch with which it is coupled or linked, and having taken all the Differences and placed them as aforesaid, then those Differences so placed will shew you the Number of each Simple to be taken to make a Composition to bear the mean Rate propounded.

-So the Branches of the last Question being linked together, as in the Manner, Pfay, the Difference between 32 and 60, is 28; which I put against 18, because 60 is linked with 18, and the Difference between 32 and 36 is 4, which I put against 24, because 36 is linked or

coupled

coupled with 24, then I say, the Difference between 32 and 24 is 8, which I place against 36 (for the Reason aforesaid) then I say, the Difference between 32 and 18 is 14, which I

place against 60; and then the Work will stand as you fee

in the Margin.

So I conclude that a Composition made of 14 Bushele of Wheat at 9 d. per Bushel, and 8 Bushels of Rye at 36 d. per Bushel, and 5 Bushels of Barley at 24 d. per Bushel, and a8 Bushels of Oats, at 18 d. per Bushel, will bear the mean Price of 32 d. or 2 s. 8 d. per Bushel. And here observe, That in the Composition there is but 14 Bushels of Wheat; but I would mingle 20 Bushels, and this Kind (or rather Case) of Alligation Alternate, viz. when there is given a certain Quantity of one of those Simples, and the Quantities of the rest sought to mingle with this given Quantity (that the whole may bear a Price propounded) is called Alligation Partial.

And the Proportion to find out the feveral Quantities to

be mingled with the given Quantity, is thus.

As the Difference annexed to the Branch, that is, the Value of an Integer of the given Quantity, is to the other particular Differences, fo is the Quantity given to the feveral

Quantities required.

So here, to find how much Rye, Barley, and Oats, must be mingled with the 20 Bushels of Wheat, I say by the Rule of Three Direct, if 14 Bushels of Wheat require? Bushels of Rye, what will 20 Bushels of Wheat require? And. 11 12 Bushels of Rye.

Again, If 14 Bushels of Wheat require 4 Bushels of Barley, what will 20 Bushels of Wheat require? Ans. 512 Bushels of Barley. Again I say, If 14 Bushels of Wheat require 28 Bushels of Oats, what will 20 Bushels of Wheat

require? Anf. 40 Bushels of Oats.

And now I say, that 20 Bushels of Wheat mingled with 11 12 Bushels of Rye, and 5 12 Bushels of Barley, and 40 Bushels of Ques, each bearing the Rate as aforesaid, will make a Composition of Heap of Corn, that may yield 32 d. aer Bushels.

But if the Branches had been coupled according to the fecond Order, or Manner, the Differences would have

been thus placed. viz. the Difference between 32 and 60 is 28, which I fet against 24, because 60 is linked thereto, and the Difference between 32 and 36 is 4, which I set against 18; and the Difference between 32

36 ) | 14 12 } 36 ) | 14 28 4

and 24 is 8, which I fet against 60; then the Difference between 32 and 18 is 14, which I set against his Yoke sellow 36; and then I conclude, that if you mixt 8 Bushels of Wheat with 14 Bushels of Rye, 28 Bushels of Barley, and a Bushels of Oats, each bearing the aforesaid Prices, the whole Mixture may be sold for 32 d, per Bushel, as by the

Work in the Margin.

You see by this Work we have sound how many Bushels of Rye, Barley, and Oats, ought to be mixed with 8 Bushels of Wheat, and to find out how many of each ought to be mixed with 20 Bushels of Wheat, I say, as 1 is to 14, so is 20 to 35 Bushels of Rye. As one is to 28, so is 20 to 70 Bushels of Barley. As as 8 is to 4, so is 20 to 10 Bushels of Oats; whereby I conclude, that if to 20 Bushels of Wheat I put 35 Bushels of Rye, 70 Bushels of Barley, and 10 Bushels of Oats, bearing each the aforesaid Price per Bushel, that then a Bushel of this Mixture will be worth 32 d. 2 s. 8 d.

And if the Branches had been linked, as you fee in the 3d Place, where each Branch bigger than the Root is link'd to two that are leffer than the Root, then in this Cafe you must have placed the several Differences between the Root and Branches, against those two with which each is coupled at first, the Difference between 32 and 60 is 28, which I set against 24 and 18, because it is coupled with them

 $32 \begin{cases} 60 \\ 36 \\ 24 \\ 18 \end{cases} \qquad \begin{vmatrix} 8 & 14 & 22 \\ 8 & 14 & 22 \\ 28 & 4 & 32 \\$ 

both, then the Difference between 32 and 36 is 4. which I fet likewise against 3, and 18, because 36 is linked to them both, then the Difference between 32 and 24 is 8 which I put against 60 and 36, because 24 is linked to

them both, then the Difference between 22 and 18 is 14. which I put against 60 and 26, the Yoke-fellows of 18.

Laftly, I draw a Line behind the Difference, and add the Differences which stand against each Branch, and put the Sum behind the faid Line against its proper Branch, as you fee in the Margin.

And now by this Work, I find that 22 Bushels of Wheet mingled with 22 Bushels of Rye, and 32 Bushels of Barley. and 22 Buffiels of Oats, each bearing the faid Price, will make a Mixture bearing the mean Rate of 32 d. per Bushel.

And to find how much of each of the rest must be mingled

with 20 Buffiels of Wheat; I fay,

As 22 is to 12, fo is 20 to 20 Bushels of Rye, As 22 is

to 32, fo is 20 to 19 3 Bufhels of Oats,

Whereby you fee the Queilions of Alligation Alternate. will admit of more true Aniwers than one; for we have found a several Answers to this first Question.

The Proof of Alternate Portial.

Onestions of Allegation Partial are proved the same Way with Questions in Alligation Medial, which you may fee in

the third Rule of the 17th Chapter.

Queft. 3. A Grocer hath 4 forts of Sugar, viz. of 12 d. per lb. of 10 d. per lb. of 6 d. per lb. and of 4 d. per lb. and would have a Composition worth 8 d. per ib. the whole Quantity whereof should contain 144 lb. made of these four Sorts, I'demand how much of each he muit take.

Questions of this Nature are resolved by that Part of Alligation Alternate, called by Arithmeticians Alligation Total, viz, where there is given the Sum and Price of feveral Simples, to find out how much of each Simple ought to be taken to make the faid Sum or Quantity, fo that it may

bear a certain Rate propounded.

To refolve this Question, I place the several Prices of the Simples and mean Rate propounded, and link them together, as is directed in the 2d and 3d Rules of this Chapter. and place the Difference between the Root and Branches. according to the 4th Rule of this Chapter, which will then stand one of these ? Ways, viz.

5. Then add the several Differences together, which I have done, and the Sums of the first and second Order age 12 l. an of the 3d, 24 l. as you see above. But it required that there should be 144 l. of the Composition, therefore to find the Quantity of each Simple to make the whole Composition 144 l. Observe this general Rule, viz.

As the Sum of the Differences is to the feveral Differences, so is the Total Quantity of the Composition to the

Quantity of each Simple.

So to find how much of each Sort of Sugar I cught to take

to make 144 1. at 8 d. per 1b.

As 12 is to 4, fo is 144 to 48 l. at 12 d. per lb.
As 12 is to 2, fo is 144 to 24 lb. at 10 d. per lb.
As 12 is to 2, fo is 144 to 24 l. at 6 d. per lb.
As 12 is to 4, fo is 144 to 48 l. at 8 d. per lb.

Whereby I find that 48 lb. at 12 d. per lb. and 246 l. at 10 d. per lb. and 24 lb. at 6 d. per lb. and 48 l. at 4 d. per lb. will make a Composition of Sugar containing 144 lb. worth at 8 d. per lb.

But as the Branches are linked in the 2d Order, the Anfiwer will be 24 lb. at 12 d. per lb. and 48 lb at 10 d. per lb. and 48 lb. at 6 d. per lb. and 24 lb. at 4 d. per lb. to make the faid Quantity, and to bear the faid Price.

And if you had worked as the Branches are linked from the third Order, then you would have found the Quantity

of 36 lb. of each.

Quef. 3. A Vintner hath four Sorts of Wine, wis. Canary

at'10 s. per Gallon, Malaga at 8 s. per Gallon, Rhenishwine at 6 s. per Gallon, and White-wine at 4 s. per Gallon. and he is minded to make a Composition of them all of 60 Gallons; that they may be worth 5 s. per Gallon, I defire to

know how much of each he must have?

The Number of Terms being ranked according to the fecond Rule of this Chapter, the Branches will be linked as followeth; but will admit of no other manner of coupling, because there is one Branch that is leffer than the Root; therefore all the rest must be linked unto it; and the Difference between the Root and the three first Branches, viz. 10, 8, and 6, which are 5, 3, 52 and I, must be set against 4, because they are coupled with it,

and the Difference between the Root, viz. 5 and 4 which is 1, must be fet against the 3 other, because it is linked to them all; fo I find that one Gallon of Canary, I Gallon of Malaga, 1 Gallon of Rhenish-wine, and 9 Gallons of White wine, prized as above, being mingled together will be worth 5 s. per Gallon, the Sum being 12 Gallons;

but there must be 60 Gallons; whereof I fay,

As 12 is to 1, fo is 60 to five Gallons of Canary. As 12 is to 1, fo is 60 to 5 Gallons of Malaga. As 12 is to 1, fo is 60 to 5 Gallons of Rhenish. As 12 is to 9, fo is 60 to 45 Gal. of White-wine.

So that 5 Gallons of Canary, 5 Gallons of Malaga, 5 Gallons of Rhenish, and 45 of White wine, mingled together, will be in all do Gallons worth 5.5. per Gallon, which was

required.

200f. 4. A Goldsmith hath Gold of four several Sorte of Finenels, viz of 24 Caracts fine, and of 22 Caracts fine, of 20 Caracts fine, and of 15 Caracts fine. [Read Ch. 2. Def. 2. of this Book. And he would mingle fo much of each with Allay, that the whole Mais of 28 Ounces of Gold fo mingled, may bear 17 Caracts fine. I demand how much of each he mult take? The 2d and 2d Rules of this Chapter being observed; (for instead of the Allay I ponto because it bears no Finenefs, but it makes a Branch in the Operation) the Terms may be alligated, and the Differences add by any of these 4 wars following, wix, Firft,

Firft thus Sum 56 Secondly thus, Thirdly thus, Sum 41 Fourthly thus,

More Ways may be given for the alligating or linking of the Terms in this Question, but these, if well practised, are sufficient for understanding the Rules of Alligation.

Sum 87

In Questions of Alligation Total, the Answer is given true, when the Sum of each of the Quantities of Simples found, [The Proof of Alternation Total] agrees with the Sum or Quantity propounded; as in the last Question, the Answer was 8 oz. 10 p. w. of 24 Caracts fine, 10 oz. of 22 Caracts fine, 9 oz. 10 p. w., of 20 Caracts fine, 4 of

25 Caracts fine, and 5 oz. of Alloy, which added together, make 28 oz. the Quantity propounded.

# CHAP. XIX. Reduction of Vulgar Fractions.

1. WHAT a Vulgar Fraction is, hath been already flewed, in the first Chapter of this Book, to which I refer the Reader to look cautiously into.

2. To reduce a Vulgar Fraction, observe carefully these 8

following Rules.

r. To reduce a mixt Number inte an improper Fraction.

2. To reduce a whole Number into an improper Frac-

3. To reduce an improper Fraction into its equivalent whole, (or mixt) Number.

4. To reduce a Braction into the lowest Terms equiva-

lent to the Fraction given.

5. To find the Valpe of a Fraction in the known parts of Coin, Weight, Measure, &c.

6. To reduce a Compound Fraction to a fimple one of the

a me Value.

7. To reduce diverse Fractions having unequal Denominations, to Fractions of the same Value, having an unequal Denominator.

8. To reduce a Fract ion of one Denomination to another

of the same Value.

I. To reduce a mint Number to an improper Fraction.

The Rule is

Multiply the Integer part for whole Number) by the Denominator of the Fraction [Vid. Chap. 1. Defin. 31.] and to the product add the Numerator, and that Sum place over the Denominator for a new Numerator, so this new Fraction shall be equal to the mixt Number given. As for Example.

whole Number 18 by 7 the Denominator, and to the product add the Numerator 3, the Sum is 129, which put over the Denominator 7, and it makes 20, for the Answer as fol-

loweth.

139

Facit 129

r,

8

t

-

f

.

2. Reduce 1,321 to an improper Fraction, Facit 2272
3. Reduce 50 31 to an improper Fraction. Facit 2272
II. To reduce an whole Number into an improper Fraction.

The Rule is, multiply the given Number by the intended Denominator, and place the Product for the Numerator

over it. [Vid. Chap. 1. Defin. 23.] As for Example.

1. Let it be required to reduce 15 into a Fraction, whose Denominator shall be 12. To effect which, I multiply 15 by the intended 12 Denominator (12) the propuct is 180 which I place over 12 as a Numerator, and it makes \(^{180}\_{12}\), which is equal to 15 \(^{180}\_{12}\) as was required; as per Margin.

2. Reduce 36 into an improper Fraction, whose Denominator shall be 26, Facit 926.

3. Reduce 135 into an improper Fraction, whose Deng-

minator shall be 16. Facit 2110.

III. To reduce an improper Fraction into its equivalent whole or mixt Number.

The Rule is, divide the Numerator by the Denominator and the Quotient is the whole Number equal to the Fraction, and if any Thing remain, put it for a Numerator over

the Divisor. Example.

1. Reduce 43 g into its equivalent mixt Number, divide the Numerator 436 by the Denominator 8, and the Quotient is 54, and 4 remains, which put for a Numerator over the Divisor 8, the Answer is 54, as followeth.

8) 436 (54

ic

T

2, Reduce 3465 to a mixt Number. Facit 23115.

IV. To reduce a Fraction into its lowest Terms equivalent to the Practice given.

The Rule is, 1. If the Numerator and Denominator are even Numbers, take half the one and half of the other, as often as may be, and when either of them falls out to be an odd Number, then divide them by any Number that you can discover, will divide both Numerator and Denominator without any Remainder; and when you have thus proceeded, as low as you can reduce them, then this new Fraction fo found out, shall be the Fraction you desire, and will be in Value to the given Fraction.

Exemple 1. Let it be required to reduce 1336 into its

lowest Terms. First, I take

the Half of the Numera- 192 96 48 24 12 4 tor 192, and it is 96, then 336 168 84 42 21 7

Helf of the Denominators,

and it is 168, so that it brought to 168, and next to \$\frac{4}{3}\$, and by halfing still, to \$\frac{2}{4}\$, and their half is \$\frac{1}{2}\$, and now I can no longer half it, because 21 is an odd Number, wherefore I try to divide them by 3, 4, 5, 6, &c. and I find 3 divides them both without any Remainder, and brings them \$\frac{1}{2}\$ as per Margin.

So I conclude 4 thus found to be equal in Value to the

given fraction 198.

2. What is 144 in its lowest Terms? Ans. 3.

3. What is 624 in its lowest Terms? Ans. 14.

The best Way to reduce a fraction in its lowest Terms, is, by finding a common Measure, vin. the greatest Number that will divide the Numerator and Denominator without any Remainder, and by that Means reduce a fraction to its lowest Terms at the first Work; and to find out this common Measure, divide the Denominator by the Numerator, and if any thing remain, divide your last Divisor by it; do so until you find nothing remaining: then this last Divisor shall be your greatest common Measurer, which will divide both Numerator and Denominator, and reduce them both into their lowest Terms at one Work.

Exam. 4, Reduce \$\frac{12}{4}\$ into its lowest Terms by a common Measurer; to effect which I divide the Denominator 304 by the Numerator 228, and there remains 76, then I divide 228 (the first Divisor) by 76 (the Remainder) and it quotes 3, and nothing remains, wherefore the last Divisor 76 is the common Measure; by which I divide the Numerator of the given fraction, viz. 228, it quotes 3 for a new Numerator, then I divide the denominator 304 by 76, and it quotes 4 for a new denominator, so that now I have sound \frac{1}{4} equal to \frac{20}{304}.

5. Reduce \$064 into its lowest Terms by a common

Meafurer, Fac. 12.

6. Reduce 20382 into its lowest Terms by a common Measurer, Fac. 23.

A Compendium.

Note, That if the Numerator or denominator of a fraction, and each with a Cypher or Cyphers, then cut off as many Cyphers from the one as from the other, and the remaining figures will be a fraction of the same Value, viz.  $\frac{1400}{7100}$  will be found to be reduced to  $\frac{14}{71}$ , by cutting off the two Cyphers from the Numerator and denominator with a daft of the Pen thus,  $\frac{14100}{71100}$ , and  $\frac{1600}{100}$  will be  $\frac{44}{70}$ , thur,  $\frac{46}{70}$ , &c.

# V. To find the Value of a Fraction in the knows Parts of Coin, Weights, &c.

The Rule is, Multiply the Numerator by the Parts of the next inferior denomination that are equal to an Unit of the same denomination with the fraction; then divide that Product by the denominator, and the Quote gives you its Value in the same Parts you multiplied by, and if any Thing remain, multiply it by the Parts of the next inferior denomination, and divide as before; do so eill you can bring it no lower, and the several Quotients, will give you the Value of the fraction as was required; and if any at last remain, place it for a Numerator over the source denominator. Some sew Examples will make the Rule plain.

1. What is the Value of 171. Sterling? To answer this Question, I multiply the Numerator 27 by 20, (the Shillings in a pound) the product is 540, which I divide by 20 (the Denominator) and the Quotient is 181. and there remains 18. which I multiply by 12 pence, and the product (216) I divide by the Denominator 29, the Quotient is 7 d. and 13 remains, which I multiply by 4 Far-things, the product is 52, which I still divide by 20. the Quotient is 1 qr. and there remaineth 23, which I put for a Numerator over the Denominator 29, po find the Value of 27 1. to he 125. 7 d. 1 gr. 27, as by the Work in the Margin, and after the fame Manner are the Values of the Fractions in the feveral Examples following found out.

Multiply	27 27 20
2	) 540 18s. 7 d. 123
	29
	250 232
Rem. Mult.	(18)
	36
•	2) 2167 d 203
Rem. Mult.	(13) 4
	9, 52 (1 <sup>21</sup> / <sub>29</sub> )
Rem.	(23) s. d. gr.
5 (0.5)	Facit 18 7 123

And so likewise you may find the Value of any Fraction, either in Weight or Time, &c.

VI. To reduce a Compound Fraction to a Simple of the

What a compound Fraction is, hath been shewn in Chap.
1. Definition 24, and to reduce it to a Simple Fraction of the same Value.

The Rule is, Multiply the Numerator continually, and place the last Product for a new Numerator, then multiply the Denominators continually, and place the last Product for a new Denominator. So this Single Fraction shall be equal to the Compound Fraction. Example.

ti

n

q

ar

m

to

CO

in

W

15

i. Reduce 3 of 3 of to a Simple Fraction.

Multiply the Numerators 2, 3 and 5 together, they make 33 for a new Numerator; then I multiply the Denominators 3, 5, and 8 together, and their Product is 120 for a Denominator, fo the Simple Fraction is 130, and cutting off the Cyphers, it is 12, equal to 2 by the 4th Rule following.

15 6

2. What is 17 of 5 of 7 of 11? Anf. 7560, or 756, or 327 in its lowest Terms.

2. What is 11 of 14 of 24 : Anf. 10011.

By this you may know how to find the Value of a Compound Fraction, siz. First reduce it into a simple one, and then find out his Value by the 5th Rule foregoing.

Example 4. What is the value of \$ of \$, of \$ of a pound?

Anf. 10 s. 11 d. 1 gr.

VII. To reduce Fractions of unequal Denominations to Fractions of the same Value, baving unequal Denominators.

The Rule is, multiply all the Denominators together, and the Product shall be the common Denominator. Then multiply each Numerator into all the Denominations except its own, and the last Product put for a Numerator over the Denominator, found out as before: So this new Fraction is equal to that Fraction whose Numerator you multiply into the said Denominator. Do so by all the Numeranors given, and you have your Deare.

Example 1. Reduce \(\frac{3}{7} \frac{4}{6}\) and \(\frac{4}{2}\) to a common Denominator. Multiply the Denominators 4, 5, 6, and 8 together continually, and put the Product 960 for the common Denominator; then multiply the Numerator 3 into the Denominators 5, 6, and 8, and the Product is 720, which is a Numerator to 960 (found as before) so \(\frac{3}{6}\) is equal to the first Fraction \(\frac{4}{2}\); then I proceed to find a

new Numerator to the 2d fraction, viz. 4, and I multiply 4 (into all the denominators) except its own, viz. into 4, 6 and 8, which produceth 760 equal to \$, then multiply the Numerator 5 into the denominators 4, 5 and 8, the Product is \$60 equal to &. Then multiply the Numerator 7 into the denominators 4, 5 and 6, the Production is \$100. equal to 7, and the Work is done; fo that for 14 and ? I have 310, 360, 500, and 340.

r. Reduce 12, 13, and 12 in a common denominator,

Facit \$790, 6786, and \$244.

#### VIII. To reduce a Fraction of one Denomination to another.

1. This is either Ascending or descending. Ascending is when a fraction of a smaller is brought to a greater denomination; descending when a fraction of a greater deno-

mination is brought lower.

2. When a fraction is to be brought from a leffer to a greater denomination, then make of it a compound fraction, by comparing it with the intermediate denominations between it, and that you would have it reduced to, then (by the 6th Rule foregoing) reduce your Compound to a fingle fraction; and the Work is done. Example,

Quest. 1. It is required to know what Part of a Pound

Sterling 2 of a Penny is?

To resolve this, I consider that I d. is 11 of a Shilling, and a Shilling is 20 of a Pound; wherefore 7 d. is 7 of 11 of 15 of a Pound, which by the faid 6th Rule I find to be 1680 of a Pound Sterling of English Morey.

Queft. 2. What Part of a Pound Troy weight is ; of a Penny-weight? Anf. ; of 10 of 12, equal to 1200 lb. Troy.

2. When a fraction is to be brought from a greater to a leffer denomination, then multiply the Numerator by the Parts contained in the feveral denominations betwixt it, and the Parts you would reduce it to; then place the last Product Queft. 4. I would reduce \$ 1. to the fraction of 1 d. to

do which, I multiply the Numerator 3 by 20 and 12, the Product is 720, which I gut over the denominator 5, it

makes 72% of 1 d. equal to 2/.

Queft. 5. What Part of an Ounce Troy is 1 16? Anf. 2, OF 4 02, CHAP. 0

#### CHAP. XX.

#### Addition of Vulgar Fractions.

1. TF your Fractions to be added have a common Denominator, then add all the Numerators together, and place their Sum for a Numerasor to the common Denominator, which new Fraction is the Sum of all the given Fractions; and if it be improper, reduce it to a whole or mixt Number. by the 3d Rule in the 29th Chapter.

Quest. 1. What is the Sum of 24 24, 24, and 14?

The Denominators are equal, viz, every one is 24, wherefore add the Numerators together, viz. 7. 9, 16, and 14. their Sum is 46, which put over the Denominator 24, it makes 11 the Sum of the given Fractions, which will be reduced to the mixt Numbers 124, or 111.

2. But if the Fractions to be added have unequal Denominators, then reduce them to a common Denominator by the 7th Rule of Chapter 19, and then add the Numerators together, and pur the Sum over the common Denominator, &c.

as before in the last Example.

Queft. 2. What is the Sum of 3, 7, 16, 11?

The Fractions reduced to a common Denominator are 3744, 5460, 2180, and 6740; the Sum of their Numerators is 17084, which put over the common Denom. makes

Queft. 3. What is the Sum of 13, 12, and 47?

3, If you are to add mixt Numbers together, then edd the Fractional Parts as before, and if their Sum be an improper Fraction, reduce it to a mixt Number, and add its integral Part to the integral Parts of the given mixt Numbers, and the Work is done.

Queft. 4. What is the Sum of 13th, and 241?

First add the Fractions 4 and on the Sum is 1 2, then add the integers 1, 13 and 14 their Sum is 38, and put after it the Fraction 12, it is 3812. Or it is 384?

Queff . 5. What is the Sum of 487, 646, and 134?

Facit 1 26 3

4. If any of the Fractions to be added is a Compound raction, it must first be reduced to a single braction by the 6th Rule of Chap. 19, and then add it to the rest, according to the second Rule of this Chapter. Example.

Quef. 6. What is the Sum of \$\frac{1}{4}\$, \$\frac{2}{6}\$, and \$\frac{7}{6}\$ of \$\frac{1}{6}\$?

Reduce \$\frac{1}{6}\$ of \$\frac{1}{6}\$ into a fimple Fraction, and it is \$\frac{1}{20}\$, which reduce with the other two, and added, are \$2\frac{1}{19}\$.

Quel. 7. What is the Sum of 12 and 2 of 5 of 6?

Anfw. 17.

5. If the Fractions to be added are not of one Denomination, they must be so reduced, and then proceed as before.

Queft. 8. What is the Sum of 1 1. and & s.

Of the given Fraction here, one is of a Pound, and the other the Fraction of a Shilling, and before you can add them together, you must reduce  $\frac{5}{6}$  s. to the Fraction of a Pound as the other is (by the 8th Rule of Chap. 19) and it makes 120 l. then  $\frac{3}{4}$  and 120 l. will be found to be  $\frac{3}{4}$ 80 l. or  $\frac{18}{8}$  l. by the 7th Rule of Chap. 19) and in its lowest

Terms 14 1. by the 4th Rule of Chap. 19.

It would have been the same (if by the latter Part of the 8th Rule of Chap. 19.) you have reduced  $\frac{3}{4}l$ , to the Fraction of a Shilling, which you would have found to have been  $\frac{6\cdot2}{4}s$ , which added to  $\frac{2}{6}s$ , by the said 17th Rule of the last Chapter, the Sum is  $15 \cdot s \cdot \frac{2\cdot9}{4}$ , which is equal to the Sum sound as before, viz.  $\frac{1}{2}$ , l tor, by the 5th Rule of Chap. 12.) the Value of  $\frac{1}{2}$ , l will be found to be 15 s. 10 d. and so will 15 s.  $\frac{2}{3}$  be found to be just as much.

Queft. 9. What is the Sum 4 1. 3 s, and \$ d?

#### CHAP. XI.

# Substraction of Vulgar Fractions.

Fractions to one Denomination, are here to be obferved; for before Subfraction can be made, the Fractions
must be reduced to a common Denominator, then subfract
one Numerator for the other, and place the Remainder
over a common Denominator, which Fraction shall be the
Ex-

Excess or Difference between the given Fractions. Exam-

ple.

Quest. 1. What is the Difference between \(\frac{1}{2}\) end \(\frac{1}{2}\)? The given Fractions are reduced to \(\frac{1}{2}\) and \(\frac{1}{2}\), then substract the Numerator 20 from the Numerator 21, and there remains 1, which being put over the Denominator 28, makes \(\frac{1}{2}\) for the Answer or Difference between \(\frac{1}{2}\) and \(\frac{1}{2}\).

Quest. 2. What is the Difference between and and of & Reduce the compound Fraction of to a simple Fraction, then proceed as before and the Answer is 132 equal to

96.

-

n

ft

m

b-

ns

act

der the Ex2. When a Fraction is given to be substracted from a whole Number, substract the Numerator from the Denominator, and put the Remainder for a Numerator to the given Denominator, and substract an Unit (for that you borrowed) from the whole Number, and the Remainder place before the Fraction found, as before, which mixed Number is the Remainder or Difference sought. Euample.

Queft. 3. Substract 17 frem 48?

Answer 47 13; for if you substract 7 (the Numerator) from 10 (the Denominator) there remains 3, which put over 10 is 13, and it makes 47 13 for the Excess.

Quelt. 4. Substract 13 from 57, remain in 56, 8.

3. If it be required to substract a Frection from a mix: Number, or one mixt Numbet from another, reduce the Fractions to a common Denominator, and if the Fraction to be substracted be lesser than the other, then substract the lesser Numerator from the greater, and that is a Numerator for the common Denominator; then substract the lesser integral Part from the greater, and the Remainder with the remaining Fractions thereunto annexed, is the Difference required between the two given mixt Numbers. Example.

Queft. 5. Subitract 26 3 from 54%.

First, Substract 7, viz. 42 from 2 viz. 32, the Remainder is 47, then 26 from 54 remaineth 28, to which annex

it maket 2817 for the Answer.

4. But if the Fraction to be substracted is greater than the Fraction from whence you substract, then having first reduced the Fractions to a common Denominator, take the Numerator of the greatest Fraction out of the Denominator,

H 2

and add the Remainder to the Numerator of the leffer Fract on, and their Sum is a new Numerator to the common Derominator, which Fraction Note, then (for the one you borrowed) add one to the integral Part to be subfracted, and substract it from the greater Number, and to the Remainder annex the Fraction you noted before, so this new mixt Number shall be the Difference sought. Example.

Quep: 6. Subftreet 144 from 294?

The Fractions reduced are, win. 4, equal to 13, and 7 equal to 18, now I should subtract 11, from 16, but I connot, therefore substract 21 from 28, rest 7, which added to 16 (the lesser Numerator) make 23 for a Numerator to 28, wix 15; then I come to the integral Parts 14 and 29, and say, I that I borrowed and 14 is 15, which taken from 29, there rests 14, to which annexing 15, it is 1415, for the Remainder or Difference between 141 and 297.

Queft. 7. Substract 36 18 from 743 ? Facit 3750.

#### CHAP. XXII.

# Multiplication of Vulgar Fractions.

ons, then multiply the Numerators together for a new Bumerator, and the Denominators for a new Denominator, and the new Fraction is the Product required.

Queft. 1. What is the product of \(\frac{1}{7}\) by \(\frac{1}{1}\). Facit \(\frac{1}{77}\); for the Numerators 5 and 9 being multiplied, make 45, and the Denominators 7 and 11 being multiplied, make 77.

2. 2. What is the product of  $\frac{3}{3}$  by  $\frac{2}{3}$ , i Facit  $\frac{1}{2}\frac{1}{2}$ .

2. If the Fractions to be multiplied be mixt Numbers reduce them to improper Fractions by the first Rule of the 19th Chapter; then proceed as before.

. 2. 1. What is the product of 281 by 121?

The given mixt Numbers being reduced to improper Fractions are 48\frac{1}{2} equal to \frac{2}{2}\frac{1}{2}, and 13\frac{1}{2} equal to \frac{8}{2}\frac{1}{2}, now and not be first Rule of this Chapter, produceth \frac{2}{2}\frac{1}{3}\frac{1}{3}\text{ or } 672\frac{1}{1}\frac{2}{2}.

Q 4. What is the product of 4301 by 187? Facil

1111 or 723570.

3. It a Compound Fraction is to be multiplied by a Sim-

ple Fraction; first reduce the Compound Fraction into a simple Fraction, then multiply the one by the other, as is taught above.

Qued. 5. What is the Product of 16 by 1 of 7 of 4.

The Compound Fraction 1 of 7 of reduced is 143, or 7 which multiplied by 16, prod. 17, which in its lowett

Terms is \$2, for the Answer.

And if the Multiplicand and Multiplier are both Compound Fractions, reduce them both to Ample ones, then multiply these new Fractions as before, so you have the Product.

Queft. 6. What is the Product of 4 of 6, by 1 of 4?

Anf. 200.

Quef. 7. What is the Product of 1 of 1 by 1 of 5?

Auf. 115, or 127.

4. It a Fraction be to be multiplied by a whole Number, put under the given whole Number an Unit for a Denominator, whereby it will be an improper fraction, then multiply the Fractions as before. Example.

Queft. 8. What is the Product of 24 by \$?

And. 22 for 24, by putting an Unit under it will be 14, and 24, by 2 produceth 18 or 16.

Queft. 9. What is the Product of 36 by 19?

Anf. 124, or 29, 1.

18

#### CHAP. XXIII.

#### Division of Vulgar Frattions.

then multiply the Numerator of the Dividend into the Denominator of the Dividend into the Denominator of the Dividend into the Denominator of the Dividend into the Numerator, and multiply the Denominator of the Dividend into the Numerator of the Dividen, and the Product is a new Denominator, which new Fraction thus found is the Quotient you defire. Example.

240 1. What isthe Quotient of & divided by . ..

Ans. 24, or 24, for the first I multiply (5) the Numerator of the Dividend into (5) the Denominator of the Divisor, and the Product (25) is a Numerator for the Quotient, then I multiply (8) the

 $\frac{3}{5}$   $\frac{5}{8}$   $\frac{2}{24}$ 

Denominator of the Dividend, into (3) the Numerator of the Divisor, and the Product (24) I put in the Quotient for the Denominator, fo I find the 22 is the Quotient fought.

Queft. 3. What is the Quotient of 12 divided by 3:

Anf. 42 equal to , inits lowest Terms.

2. But if you will divide a fimple Fraction by a Compound. or a Compound by a Simple, first reduce such Compound to

a Simple Fraction, then go on as before.

Queft. 4. What is the Quotient of 10 divided by 4 of 2: Anf, 13 or 6 first reduce 1 of 3 into a Simple Fraction, and it is 14, by which 10 being divided, the Quotient it 36 equal in the least Terms to 3. And if the Dividend and Divisor be both of Compound Fractions, reduce them both to a Simple Fraction, then divide the one by the other, as in Rule r. foregoing.

Quef. 4. What is the Quote of 3 of 1 divided by 2 of 1?

Anf. 166, or 13 in its lowest Terms.

3. If the Dividend, or Divisor, or both, are mixed Numbers, reduce them to improper Fractions, and perform Divifion as you are taught before.

Queft. 5. What is the Quote of 122 divided by 21 4? Anf. 255, for 123 is equal to 1. and 214 is equal to 109, and the Quote of 1 divided by 109 is as before

1. If you divide a Fraction by a whole Number, or a whole Number by a Fraction, make the whole Number an improper Fraction, by putting an Unit for a Denominator to it, was taught in Rule 4. Chap. 22. and then perform Division as was before taught.

Example. 2neft. 6. What is the Quote of 8 divided by ??

Anf. 42, which is equal to 13], being reduced as is before  $\frac{3}{5}$   $\left(\frac{40}{3} \text{ or } 13\frac{3}{5}\right)$ directed. See the Work in the Margin.

Queft. 7. What is the Quote of 3 divided by 8? Anf. 43 as per Margin.

#### CHAP. XIV.

# The Rule of Three Direct in Vulgar Fractions.

A S in the Rule of Three in whole Numbers, fo like wife in Fractions, you must fee that the Fractions othe first and third Places be of the same Denominations.

2. If any of the given Fractions be compound, let them'

be reduced to simple of the same Value.

3. If there are given mixed Numbers, reduce them to im-

proper Fractions by the first Rule of Chap. XIX.

4. If any of the three Terms is a whole Number, make it an improper Fraction by conftituting the Unit for its Denominator.

Having reduced your Fraction as is directed in the 4 last Rules, then proceed to a Resolution, which is performed the same Way as in whole Numbers. Respect being had to the Rules delivered for the Working of Fractions, viz.-Multiply the 2d and 3d Fractions together, according to the first Rule of Chap. XXII. and divide the Product by the first Fraction, according to the first Rule of Chap. XXIII, and the Quotient is the Answer.

Or, (which is better)

5. Multiply the Numerator of the first Fraction into the Denominator of the second and third, and the Product is a new Denominator; then multiply the Denominator of the first Fraction into the Numerator of the 2d and 3d, and the Product is a new Numerator, which new Fraction is the 4th Proportional or Answer, which, if it be an improper Fraction, must be reduced to a whole or mixed Number by the 3d Rule of Chap. XIX. Example.

Queft. 1. If & Yards of Cloth coft & 1. what will 10 Yards

coft ?

ı

Having placed the given Fractions according to the 6th Rule of Chap. X. I proceed to the Resolution, and first I multiply the Numerator of the first Fraction (3) into 8 and 10, the Denominations of the second and third Fractions, and the Product is 240 for a Denominator; then H 4

equal to 4 or 15 s. Queft. 2. If & 1. buy & Yards of Cloth, what will !! Yds

coft at that Rate?

Anf. 110 equal to 11 1, or 14 s. 8 d.

Queft. 3. Il & 1. coft & s. what will &s. buy?

Anf. 376/. equal to 137 1.

Quest: 5. if ; of an Ell of Holland cost 61. what will 125

Anf. 21. 16s. 13 d.

In refolving the last Question and the two next, observe the 3d Rule of the Chapter foregoing.

24.0. 5. If 20 of a C. coft 284 s. what will 71 C. coft at

that Rate?

Anf. 239 7 s. or 111. 19 s. 7d.

Queft. 6. If 3. Yards of Velver con 3 1. how much will 10 Yards coil at that Rate?

Anf. 11.71.

Queft. 7. If 5 Yards of Broad Cloth coft 241. what will 143 Yards coft?

Anf. 131. 9 s. 4 d.

In working the last Question, and the four next, observe the 4th Rule of the Chapter foregoing.

Queft. 8. If 14 lb. of Pepper coft 14s. 63d. I demand the

Price of 7341.

Ans. 31. 16s. 812 d. Quef. 2. If 11. of Cochineel cost 1 1. 5 s. what will 36161. coft.

Anf. 47 1. 175. 6 8.

Quef. 19. If a Yard of Broad Cloth coft 153s. what will four Pieces, each containing 273 yards coft at that Rate. Anf. 85 1. 14s. 37 d.

Quef. 11' A Morcer bought 31 Pieces of Silk, each Piece contained 343 Ells' at 6 s. 2 d. per Ell; I demand the Value of 21 Pieces at that Rate.

Anf. 26 1. 3 s. 41d.

In relating the four next Questions, observe the 8th Rule of Chap. 19.

Queft. 12. If & of an Ounce of Silver coft 2s. I demand

the Price of 11 \$ 1. at that Rate?

Anf. 351.

1.00

Quest. 13. If 15 1b. of Gold is worth 6151. Sterling, what is a Grain worth at that Rate.

Auf. 1 1 d.

Quest. 14. If \(\frac{1}{4}\) Yards of Silk is worth \(\frac{1}{4}\) of \(\frac{6}{6}\)!. what is the Price of 15\(\frac{6}{6}\) Ells Flemish.

Auf. 601.6 s. 8 d.

Queft 15. If \$ of a Pound of Cloves cost 6s. 27 d, what cost the C. weight at that Rate.

Auf. 60 1. 6 s. 8 d.

Note, That when the Answer to the Question in this and the next Chapter are given in Fractions, they are given in the lowest Terms.

# CHAP. XXV. The Rule of Three Inverse in Fractions.

I. I T hath been already taught (in the 3d Rule of the 1sth Chapter) how to discover when the 4th propostional Number (to the three given Numbers) is to be found out by a Rule of Three Direct, and when by a Rule of Three Inverte; to which Rule the Learner is now referred.

by the Rule of Three Inverte, viz. when the third Term is the Divisor, then having reduced the Terms exactly (according to the Rules in Chap. 24.) multiply the Numerators of the third Fraction into the Denominators of the 21 and 1st Fractions, and the Product is a new Denominator; then multiply the Denominator of the 31 fraction into the Numerators of the 2d and 1st fractions, and the Product is a new Numerator, which new fraction thus found, is the Antwer to the Question.

2 at 1.

Quest. 1. If \$\frac{1}{4}\$ of a Yard of Cloth that is two Yards wide, will make a Garment, how much of any other Drapery that is \$\frac{1}{4}\$ of a Yard wide will make the some Garment?

Anf. 21 Yards.

guest. 2. I lent my Friend 46 l. for \$ of a Year, how much ought he to lend me for 27 Parts of a Year?

Anf. 61.

Quest. 3. If \(\frac{2}{3}\) of a Yard of Cloth that is  $2\frac{7}{2}$  Yards wide will make any Garment what Breadth is that Cloth when  $2\frac{1}{4}$  Yard will make the same Garment?

Anf. 33 of a Yard wide.

Quest. 4. How many Inches in Length of a Board that is 9 Inches broad, will make a Foot square?

Anf. 16 Inches in Length.

Quest. 5. If when the Bushel of Wheat cost 41. 4, the Penny loaf weighed 10\frac{3}{2} Ounces, what will it weigh when the Bushel cost 8 s. 12?

Anf. 5 11 Ounces.

Quest. 6. If 17 Men can Mow 24! Acres in 10! Days, in how many Days will 6 Men do the same?

Anf. In 21 Days.

### CHAP. XXVI.

# Rules of Practice.

IN the fingle Rule of Three, when the first of the 3

Numbers in the Question (after they are disposed according to the 6th Rule of Chap. 10.) happeneth to be an Unit (or 1) that Question many Times may be resolved far more speedily than by the Rule of Three, which kind of Operation is commonly called Practice, and indeed is of excellent Use among Merchants and Tradesmen, and others, by Reason of its Speediness in finding a Resolution to such kind or Questions.

2. The chiefest Questions resolvable by these chief Rules may be comprehended under the general Heads or Cases fol-

lowing.

When

confiits.

W

n

9

When the 2 Of Pence under 12. given Price 3 Of Pence and Farthings. of the Integer 4 Of Shillings under 20.

of Shillings, Pence, and Farthings.

6 Of Pounds.

of Pounds, Shillings, Pence, and Far.

It would be very convenient for the Practical Arithms tician to have by Heart the feveral Products of the o Digits multiplied by 12, for his speedy reducing Pence into Shillings, and Shillings into Pence, which he may gain by thefollowing Table.

2. Shillings are practically reduced into Pounds, thus viz. Cut off the Figure standing in the Place of Units with a Dash of the Pen, and note it for Shillings, then draw a Line under the given Number, and take half the remaining Figures (after the first is cut off) and fet them

under the Line, and they are fo many Pounds; but if the last Figure is odd then take the leffer half, and add to to the Figure 10 cut off (as before) for

4365 8 L

Shillings; as if I were to reduce 43658 Shillings into Pounds, first I cut off the

2182

last Figure (8) for Shillings, then I take half of the remaining Figures (4365) thus, half of 2 is 1, which I put under the Line, then half of 3 is 1, and because 3 is an odd Number, I make the next Figure 6 be 16, and I go on, faying, half of 16 is 8. then half of 5 is 2. which is the last Figure. wherefore because 5 is an odd Number, I add 13 to the 8 I cut off, and it makes 18 s. fo that I find it to be 2182 1. 181. as per Margin.

4. It is likewise convenient that the Learner be acquaint ed with the practical Tables following, the first containing the Aliquot or even parts of a Shilling, the 2d containing the Aliquot parts of a pound.

Cafe I.

5. When the price of the Integer is a Farthing, then take the 6th part of the given Number, which will be fo many Three-half-pences, and it any Thing remain it is Farthings, by the 7th Rule of Chap. 9. then confider that Three-half-pence is \( \frac{1}{2} \) of a Shilling, wherefore take the 8th part of them for Shillings, and if any Thing remain, they are fo many Three-half-pences, which reduce into Pounds by the third Rule foregoing. Example, What comes 67486 lb. to, at a Farthing per lb? First, Itake \( \frac{1}{2} \) of 67486, and it is 1147 Three-half pences and four Farthings, or 1 Penny, then \( \frac{1}{2} \) of 11247 is 8403 s. and feven remains, which is seven Three half pences, or 10\( \frac{1}{2} \) d. which with the four Farthings before, make 11\( \frac{1}{2} \) d. and 1405 s. which by the third Rule is 70 l. 5 s. In all 70 l. 5 s. 11\( \frac{1}{2} \) d. for the Antwers-See the Work following.

Other Examples follow,

1 8576 1. at 1 qr.		37/	2
1072	1 6	1043	3 qrs.
s. d.		17   3 5	d. 3 grs. d. grs.
	17   8———————————————————————————————————		17   8 8 d. 17   3 5

5. When the Price of the Integer is 2 Farthings, then take the third Part of the given Number, for io many three half-pence, and the Remainder, if any, is Half pence, then take the Eighth Part of that for Shillings, &c.

7. When the Price of the Integer is 3 Farthings, then take half the given Number for three-half-pence, and if any thing remain it is 3 Farthings, then take the 8th for Shillings, as before.

2	4736 l. at 3 grs.		5425 l. at 3 grs.
1	2368	7	2712 3 grs.
-	29   6		33   9
	1. s. 15 16 Facit.		l. s. d. qrs. 16 19 0 3 Facit.

8. When the given Price of the Integer, is a Part or Parts of a Shilling, (viz. Pence) divide the given Number of Integers, whose Value is fought, by the Denominator of the Fraction, representing the even Part, and the Quote is Shillings, always minding the 7th Rule

Rule of the 9th Chapter) and those Shillings may be reduced into Pounds by the third Rule of this Chapter. Example: Let it be required to find the Value of 438 lb. at 3 d. per lb.. I consider 3 d. is 4 of a Shilling, and 438 lb. will cost so many 3 Pences, wherefore I divide 438 by 4 the Denominator, or 4, and the Quote is 109 Shillings, and two remains, which is two 3 d. or 6 d. the whole Value is 5 l. 9 s. 6 d. as by the following Work appeareth.

If the Learner is minded to try the Fruitfulness of his Genius he may frame as many Examplet as he thinks fit, and

work them as before.

o. If the Price of the Integer be Pence under 12, and yet not an even Part, then it may be divided into even Parts, and fo the Parts of the given Numbers taken accordingly, and added together, as if it were 5d. which is 2 d. and 2 d. viz. 1 and 1 of a Shilling, first take 1 of the given Number, and then thereof, and add them together, and their Sums is the Answer in Shillings, still obferving Rule 7 of Chapter 9, for the Remainder (if any be) then bring the Shillings into Pounds by the 3d Rule foregoing. Likewife 7 d. is ; and 4, so 9 d. is 1 and 4, and rod. is and 3, and rrd. is 4 and 3 of a Shilling; or elfe many Times your Work may be shortened thus, viz. when the faid given Price is to be divided into even Parts of a Shilling, or of a Pound, after you have taken the first even Part, the other may be an even Part of that Part, as in the next Examples, where are given 439 lb. at 5 d. per lb. now I may divide is thus, viz. into 4d. and 1d. and 4d. being 4 of 439 lb. and it gives 146 s. 4 d. and for the 1 d. I take 4 of 146 s. 4 d. which is 36 s. 7 d which in all comes to 9 l. 2 s. 11 d. Examples follow.

nap	13. Kule of	Pi	
	1. d. 439 at 5 per lb.		yds. d. 417 at 9 per y
3	146 4	1.	208 6
1	36 7	1 20	104 3
	18   2 11		31   2 11
	91. 2 s. 11 d. Facit		15 l. 12 s. 9 d. Facit.
	Ells d. 587 at 7 per Ell		Ells d. 386 at 10
3	195 8	1 2	193
4	146 9	3	128 8
	34   2 5		32   1 8
	17 1. 2 s. 5 d. Fac.		16 l. 1 s. 8 d. Facit.
	yds d. 836 at 8 peryd.		l. d. 534 at 11
3	278 8	1	267
4	278 8	3	178
	55   7 4	14	44 6
	27l. 17s. 4d. Facit.		48   9 6 24 l. 9 s. 6 d. Facit.

10. When the Priec of the Integer is Pence and Farthings, if it make an even Part of a Shilling, work as before; but if they are uneven, as Penny-Farthing, Penny three Farthings, 2 d. 1 gr. or 2 d. 3 grs. 3 d. 3 grs. or the like, then first Work for some even Part, and then consider what Part the rest is of that even Part, and divide that Quotient thereby, then add them together,

and reduce them to Pounds as before. Example, 3470 l. at 1 d. 1 qr. per lb. First I work for the Penny by dividing 3470 lb. by 12, for 1 d. is 11 of a Shilling, and the Quote is 289 s. 2 d. then I conceive that one Farthing is the 4 of 1 d. and the Value of one Farthing will be 4 of the Value of 1 d. and therefore I take 4 of 289 s. 2 d which is 72 s. 3 d. 2 qrs. then add them to gether, and they are 18 l. 1 s. 5 d. 2 qrs. as by the Margin.

1	1. d. qrs. 3470 at 1 1
1	289 2 72 3
20	36   1 3 =
	1. s. d. q. 18 1 5 2

th

W

A

pe P

A

6

N

of

figure is the place of Units of the given Number, and double it for Shillings, and the figures on the other Hand are Pounds. Example 436 yards at 2 s. per yard, cut off the last Figure 6 and double it, 43 | 6 makes 12 s. and the other two Figures, viz. 43, are in many pounds; fo that their Value is 43 l. 12 s.

43 l. 12 s. as per Margin.

12. Hence it is evident that when the given Price of an Integer is an even Number of Shillings, then if you take half of that (even Number of Shillings, and multiply the given Number of Integers thereby, doubling the first Figure of the Product, and ferting it apart for Shillings, the reft of the product will be Pounds, which Pounds and Shirlings are the Value fought. Example. What coft 536 yards at 8 s. per yard? To reloive which, I take half of 8s. (the Price of a yard) which is 4, and multiply 536 t hereby, faving, 4 times 6 is 24, then I do uble the first Figure 4 makes 8 tor 536 yes at 8 Shillings and carry 2 to the next Product, &c. I find the reft of the Product to be .214 2141. 8 s. which I note for Pounds; to that the Value of 536 yards at 8 s. per yard, is 214 l. 8 s. as by the Margin. Other Examples of the tame Kind may be wrought

after the same Manner.

13. If the given Price of the Integer is an odd Number of Shillings, then work the First for the even Number

2

2

nt

.

er

æ

of Shillings by the last Rule, and for the odd Shilling take 2 of the given Number of Integers, according to the 3d Rule of this Chapter, and add them together, and you have your Defire. Examples follow.

<i>Yds.</i> 422 a	t 3 per Yard
1. 42 21	4 2

275	o8 Facit.

14. Except when the given Price of the Integer is 5 s. for then it is fooner answered by taking 4 of the given Number, whose Value is fought, as in the following Example.

Pence, or Shillings, Pence, and Farthings; then divide the given Number of Integers whose Value you seek by the Denominator of that Fraction representing that even Part. As for Example, What is the Price of 284 Yards at 6 s. 8d. per Yard? Here I consider that 6 s. 8 d. is one third of a Pound, wherefore divide 384 by 3, and the Quote is the Answer, viz. 128 l. so that 384 Yards at 6 s. 8 d. per Yard, amounts to 128 l. as per Margin, still observing the 7th Rule of the 3 128 l.

16. When the given Value of the Integer is Shillings

and Pence, and not an even Part of a Pound, yet many times it may be divided into Parts, (viz.6s, 6d. is 4s. and 2s. 6d.) for the 4s. Work according to the 12th Rule foregoing, and for the 2s. 6d. take the eight Part of the given Number, and add them together, then their Sum is the Value required.

So 8s. 6d. will be divided into 6s. and 2s. 6d. and the Price of the given Number may be found out as before, &c.

Examples follow.

yds. s. d.	s.   Ells s. d.
386 at 8 8	240 at 5 4
1 128 l. 13 4	60 0
38 12 0	4 0
167 l. 5 s. 4 d. Fac.	64 l. Facit

177 1. 18 s. 4 d. Fac.	321 l. 1 4 Facit.

17. When the given Price of an Integer is Shillings and Pence, and you cannot readily divide them according to the last Rule, then multiply the given Number, whose Value you feek, by the Number of Shillings in the Price of the Integer, and then for the Pence work by the 8th Rule foregoing; then add the Numbers together, and their Sum is their Value fought in Shillings; as for Example: What is the Value of 392 Yards at 6 s. 9 d. per Yard. Here 6 s. o d. cannot be made an even Part, nor indeed can it be divided into even Parts of a Pound; wherefore I multiply the given Number of Yards 392 by 6 for the 64 the Product is 2352 s. then for the 9 d. I divide it into 6 d. and 2 d. and work for them by the 8th Rule foregoing; and at last add the Shillings together, they make 2646 s. and by the 3d they are reduced to 132 1.63. the Value of 92 Yards at 6 s. 9 d. per Yard, See the Work.

-392 yds at 6 s. 9 d.

2352
196
98
264|6

In like Manner Variety of other Examples be wrought.

18. When the given Price of the Integer is Shillings
Pence, and Farthings, then multiply the given Number of
Integers, by the Number of Shillings contained in the Value
of the Integer, and for the Pence and Farthings follow the

10th Rule of this Chapter.

first take the Half of the given Value, and then half of that half, fetting each Part under the Precedent, then adding them together, their Sum will be the required Value of the Integers and their Parts. Example, What is the Value of 116 Yards, at 4 s. 6 d. per Yard? To give an Answer, First I work for the Value of 116 Yards

by the 5th Rule foregoing, and then yds for the half Yards, I take half of 116 at 4 4 s. 6 d. which is 2 s. 3 d. and add to the rest found as before, then is that Sum the total Value of 116 yards at 4 s. 6 d. per Yard which I find to amount to 26 l. 4 s. 3 d. as by the Work in the Margin. And 26 4 3 Facit.

11 6. 125. 141. 10 d. 2 5. yards. 23

all other Examples of this Kind, are wrought the fame Way. Many more Questions may be stated, and several other Rules of Practice may be flewn according to the Methods of diverse Authors; but what have been delivered here, are fufficient for the Practical Arithmetician in all Cases whatfoever.

#### CHAP. XXVII.

# The Rule of Barter.

1. D Arter is a Rule among Merchants, which (in the Exchange of one Commodity for another) inform them fo to proportion their Rates, as that neither may fustain Lois.

2. To refolve Questions in Barter, will not be difficult to him that is acquainted with the Golden Rule, or Rule of Three, it being altogether used in resolving such Questi-

Queft. 1. Two Merchants, (viz. A and B) Barter, A hath 13 C. 3 grs. 15 lb. of Pepper at 2 l. 16 s. per C. and B hath Cotton at 9 d. per 1b. I demand how much B must A for his Pepper?

Anf. 9 C. 1 gr.

First find by the Rule of Three, or the Lule of Practice foregoing, how much the Pepper is worth, faying,

t

y.

er

ds

re

at-

x-

em

ain

t to

e of

rac-

ring,

If 1 C. coft 2 l. 16 s. what will 13 C. 3 grr. 14 lb. coft ? Anf. 38 l. 17 s.

Secondly. by the Rule of Three, fay, if 9 d. buy 1 16.

of Cotton, how much will 38% 17 s. buy?

13 C. 3 qrs. 141. of Pepper, at 21. 16s. per Cent. when

the Cotton is worth 9 d. per 1b:

Queft. 2. A and B Barrer, A hath 120 Yards of Bread Cloth, worth 6 s. per Yard, But in the Barrer he will have 8 s. per Yard; B hath Shalloon worth 4 s. per Yard. Now I demand how many Yarns of Shalloon B must give A for his Broad cloth, making his gain in Barrer equal to that of A.

Anf. 110 Yards of Shalloon.

First (as in the last Question) find out how B ought to fell his Shalloon in Barter, viz. say, if 6 s. require 8 s. what will 4 s. require?

Anf. 5 s. 4d.

Thus you fee that B must fell his Shalloon in Barter at

55. 4 d. if A fell his Broad cloth at 8 s. per Yard.

It remeineth now to find our how much Shalloon B must give for 120 Yards of Broad-cloth, which resolved after the Method in the first Question of this Chapter is found to be 180, and so many Yardsrof Shalloon must be give A for the 100 Yards of Broad-cloth.

Quest. 3. A and B bartered, A had 14 C. of Sugar worth 6 d. per. 16. for which he gave him 1 C. 3 qrs. of Cinna-

mon, I demand how B rated his Cinnamon per 1b.

Anf. 4s. per 1b.

Quest. 4. A and B bartet, A hath 4 Tons of Brandy werth 37 1. 16 s. ready Money, but in Barter he hath 50 1.

1 s. fer Ton, and gives h B 21 C. 3 qrs. 11 6 l. of Ginger for the 4 Tons of Brands. I defire to know how much B fold his Ginger in Barter 25 C. and how much it is worth in ready Money?

Anf. For 9 1, 6 s. 8 d. in Barter, and it is worth 7 1. per

Cent. in ready Money?

Quest. 5. A and B briter, A hath 320 Dozen of Candles, at 45. 6 d. per Dozen, for which B giveth him 30 l. in Money, and the rest in Cotton at 8 d. per lb. I demand how much Cotton he must give him more than 30 l.

Anf. 11 C. 1 gr.

#### CHAP. XXVIII.

# Questions in Loss and Gain.

A Merchant bought 436 Yards of Broad cloth for 8 s. 6 d. per Yard, and felleth it again at 10 s. 4 d. per Yard; now I defire to know how much he gained in the 436 Yards?

Anfw. 39 1. 12 8. 4 d.

First, Find out by the Rule of Three, or by Practice, how much the Cloth cost him at 8 s. 6 d. per Yard, which I find to be 1.13 l. 6 s. then by the same Rule sind out how much he fold it for, wis. 225 l. 5 s. 4 d. then substract 183 l. 6 s. which it cost him, for 225 l. 5 s. 4 d. which he fold it for, and there remaineth 31 l. 19 s. 4 d. for his Gain in the Sale thereof.

Otherwise, it may sooner be resolved thes, first find out how much he gained per Yard, viz. Substract 8.5. 6 d. which he gave per Yard, from 105. 4 d. which he fold it for per Yard, the Remainder is 15. 10 d. for his Gain per Yard, then say.

If one Yard gain 1 s. 10 d. what will 436 Yards gain? the Answer by Practice, or the Rule of Three, is 31 l.

19 1.4 d. as was found before.

Queft. 2. A Draper bought 124 Yards of Holland, for which he gave 31 l. I defire to know how he must fell it per Yard to gain 10 l. 6 s. 8 d. in the whole Sale of 124 yards?

Auf. At 6 s. 8 d. per yard.

Add the Price which it cost him, wix 31 1. to his intended Gain, viz. 10 1. 6 1. 8 d. the Sum is 41 1. 6 s. 8 d. Then fay.

If 124 yards require 41 1. 6 s. 8 d. what will 1 yard require? By the Rule of Three I find the Answer 6 s. 8 d.

Quest. 3. A Greer bought 3 C. 1 qr. 13 lb. of Cloves, which cost him 2 s. 4 d. per lb. and fold them for 52 l. 14 s. I defire to know how much he gained in the Whole?

A.f. 8 1. 12 s.

Quest. 4. A Draper bought 86 Kerleys for 129 l. I demand how he must fell them per Piece to gain 15 l. in laying out 100 l. at that Rate? Ans. 1 l. 14 s. 6 d. per Piece; for,

d

.

h

3

t

1.

n

ı.

T

.

s.

.

5.

-

As 100 is to 115 %. fo is 129 % to 148 % 7 1.

So that by the Proportion above, I have found how much he must receive for the 86 Kerseys, to gain after the Rate of 15 per C. Then to find how he must fell them per Piece, I say,

As 86 piecces are to 141 l. 7 s. fo is one piece to 1 l., 14 s.

6 d. which is the Number fought.

Quest. 5, A Grocer bought 4! C. of Pepper for 151.
17 s. 4 d. and it proving to be damnified) is willing to lose 12 l. 10 s. per Cent, I demand how he must sell it per l.

Anf. 7 d. per 1.

Substract 121. 10 s. the Loss of 100 l. from 100 l.

and there remains 87 l. 10 s. Then fay,

As 800 l. is to 87 l. 10s. so is 15 l. 17 s. 4 d. to 13 l. 17 s. 8 d. and so much he must fell it all for, to lose after the Rate propounded: Then to know how he must fell it per l. I say,

As 13 1. 17 s. 6d is to 44 C. fo is 1 1. to 7 d.

Quest. 6. A Plummer fold 10 Fodder of Lead (the Fodder containing 19 ½ C) for 2041. 10 s. and gained after the Rate of 12 l. 10 s. per 100 l. I demand how much it cost him per C?

To resolve this Question, add 12 l. 10 s. (the Gain per

Cent ) to 100 l. and it makes 112 l. 10s. Then fay,

As 112 l. 10 s. is to 100 l. so is 204 l. 15 s. to 182 l. which 182 l. is the Sum it cost him in all; then reduce your 10 Fodders to Half Hundreds, and it makes 390. Then say,

As 390 Half Hundreds is to 182 l. so is 2 Half Hundreds to 18 s. 8 d. the price of two Half Hundreds, or t

C. wt. and so much it stood him in per C. wt.

Quest. 7: A Merchant bought eight Tuns of Wine, which being sophisticated, he selleth for 400 l. and loseth after the Rate of 12 l. in receiving 100 l. Now I demand how much it cost hin per Tun, and how he selleth it per Gallon to lose after the said Rate?

Answer. It cost him 561. per Tun, and he must sell it at 3 s. 11 d.21 grs. per Gallon, to lose 131. in receiving

1001.

To resolve this Question, I consider, in the first Place, that in receiving 100 l. he loseth 12 l. therefore 100 l. comes in for 112 l. laid out; wherefore to find out how much he laid out for the whole, I say,

As 100 l. is to 112 l. fo is 400 l. to 448 l. and fo much the 8 Tun cost him: Then to find how much it cost per

Tun, I fay,

As 8 is to 4481. fo is 1 to 561. the Price it cost per

Now to find how he must fell it per Gallen, reduce the

Tuns into Gallons, make 2016. Then fay,

As 2016 Gallons is to 400 l. so is r Gallon to 3 s. 11 d. 2 qrs. the Price he must fell it at per Gallon to lose as af resaid.

200ft. 8. A Merchant bought 8 Tuns of Wine, which being tophitticated, he is willing to fell for 400ft and lofeth at that Rate 12 l. in laying out 100 l. upon the fame, now I demand how much it cost him per Tun?

Here I confider that for 100 l. laid out, he received but

88 l. wherefore to find what 8 Tuns coft him, I fay,

As 88 1. is to rool. so is 400 l. to 454 l. , the Price it all cost him; then to find out how much per Tun, I say,

As 8 is to 454 14, fo is 1 to 56 l. 16 s. 4 d. 2 grs. per

#### CHAP. XXIX.

### Equation of Payments.

Requation of Payments is that Rule among Merchants, whereby we reduce the Times for the Payment of several Sums of Money to an equated Time for Payment of the whole Debr, without Damage to Debter or Creditor; and,

The Rule is.

2. Multiply the Sums of each particular Payment by its respective Tinte, then add the several Products together, and their Sum divide by the total Debt, and the Quotient thence arising is the equated Time, for the Payment of the Mole Debt. Example.

Quel.

Queft. t. A is indebted to B in the Sum of 100 l. whereof 50 l. is to be paid at 2 Months, and 50 l. at 4 Months,
and the rest at 6 Months, now they agree to make one
Payment of the total Sum; the Question is, What is the
equated Time for Payment, without Damage to Debtor or
Creditor?

To resolve this Question, I multiply each Payment by its

Time, viz.

2,

1.

W

h

er

he

S.

ch

0-

ne,

out

it

-

er

10

its

et,

ent

the

The Sum of the Product is—480
Then I divide 480 (the Sum of the Products) by 130
(the total Debt) and the Quotient is 3% Months for the

Time of paying the whole Debt.

Quest. 2. A Merchant hath owing him 1000 l. to be paid as followeth, viz. 600 l. at 4 Months, 200 l. at 6 Months, and the rest (which is 200 l.) at 12 Months, and he agreeth with the Debtor to make one Payment of the whole, I demand the Time of Payment without Damage to Debtor or Creditor?

600 1. Multiplied by 4 Mooths is 2400
200 1. Multiplied by 6 Months is 1200
200 1. Multiplied by 12 Months is 2400

The Sum of the Product is—6000 and the Sum of the Products (6000) being divided by the whole Debt (10001.) quotes 6 Months for the Time of Payment of the whole Debt.

3. The Truth of the Rule is thus manifest, if the Inte-

rest of that Money which is paid by the equated Time (after it is due, be equal to the Proof of the Interest of that Money, which by the equated Time) is paid so much sooner than it is due at any Rate per C. then the Operation is true, otherwise not. Example.

In the last Question 600 l. should have been paid at 4 Months, but it is not discharged till 6 Months (that is 2 Months after it is all due) wherefore its Interest of 2 Months at 6 per C. per Annum is 6 l. and then 200 l.

1 2

was to be paid at 6 Months, which is the equated Time for its Payment, therfore no Interest is reckoned for it; but 200 l. should have been paid at 12 Months, but is paid at 6 Months, which is 6 Months sooner than it ought, wherefore the Interest of 200 l. for 6 Months is 6 l. (accounting 6 l. per Cent per Annum) which is equal to the Interest of 600 l. for 2 Months, wherefore the Work is right.

Quest. 3. A Merchant hath owing him a certain Sum to be discharged at 3 equal payments, viz. 3 at two Months, 3 at four Months, and 3 at eight Months, the Question is, What is the equated Time for the Payment of the whole

Debt?

In Questions of this Nature, viz. where the Debt is divided into unequal Parts, each of its Parts is to be multiplied by its Time, and the Sum of the Product is the Anfwer.

multiplied by 2 Mon. produceth 3 multiplied by 4 Mon. produceth 1 3 multiplied by 8 Mon. produceth 2 4

The Sum of the Product is  $4\frac{2}{3}$  which is  $4\frac{2}{3}$  Months for the epuated Time of Payment.

It instead of the Fractions representing the Parts, you had wrought by the Numbers themselves (represented by those Farts) according to the first and second Example, it would have been the same Answer, and suppose the Debt had been go I then is of it is 30 I for each Payment, viz. at 2, 4, and 8 Months. Then,

30 l. multiplied by 2 Mon. produceth 60 30 l. multiplied by 4 Mon. produceth 130 30 l. multiplied by 8 Mor. produceth 240

The Sum of the Product is 420

which divided by 90 (the whole Debt) quoteth 490, or

4ª Months as before.

Quest. 4. A Merchant oweth a Sum of Money to be paid 2 at 5 Months, and 2 at 8 Months, and 2 at 10 Months, and he agreeth with his Creditor to make one total Payment; I demand the Time without Damage to Deb-

1

fi

S

fei th

al

tor or Creditor; Work as in the last Question, and you

will find the Answer to be 7 Months.

Quest. 5. A is indebted to B 640 l. whereof he is to pay 40 l. present Money, 350 l. at 3 Months, and the rest, viz. 250 l. at 8 Months, and they agree to make an equated Time for the whole Payment, now I demand the Time?

In Question of this Nature, viz. where there is ready Money paid) you are multiplying to neglect the Money that is to be paid present, and work with the rest, as is before directed, and divide the Sum of the Products by the whole Debt, and the Quote is the Answer; for here 40 l. is to be paid present, and hath no Time allowed; and according to the Rule it should be multipled, by its Time, which is 0; therefore 40 Times 0 is 0, which nether augmenteth not diminishes the Dividend; wherefore to proceed (according to Direction) I say,

353 by 3 Months, produceth—1050 250 by 3 Months, produceth—2000

The Sum of the Product is 3050

which divided by 640. the whole Debt, the Quite is 422

Months, the Time of Payment.

u

it

ot

z,

10

be

obQuest. 6. A is indebted to B is a certain Sum, half-whereof is to be paid prefent Money, one 3d at 6 Months, and the rest at 8 Months; now I demand the equated Time for Payment of it all?

Anf. 21 Months is the Time of Payment.

Quest. 7. A is indebted to B 120 l. whereof is to be paid at 3 Months, 4 at 6 Months, and the rest at 9 Months. What is the equated Time of the Payment of the whole Sum?

Answer. At 6 Months?

Quest. 8. A is indebted to B 420 l. which is due at the End of 6 Months, but A is willing to pay him 140 l. prefent provided he can have the Remainder forborn so much the longer, to make Satisfaction for his Kindness; which is agreed upon, I desire to know what Time ought to be allotted for his Payment of the 280 l. remaining?

The Operation of this Question is lest to the Learners to try his Genius; and who, in this Case, must have an Eye to the Rule of Three.

Chap. 30.

.

## CHAP. XXX.

## EXCHANGE,

THE Rule of Exchange informeth the Merchants how to exchange Monies, Weights, or Measures of one Country into (or for) the Monies, Weights, or Measures of another Country, and when the Rate, Reason, or Proportion betwixt the Money, Weights, or Measures of different Countries is known, it will not be difficult for the Practitioner that is well acquainted with the Rule of Proportion (or Rule of Three) to resolve any Question, wherein it is required to exchange a given Quantity of the one Kind into the same Value of another Kind.

2. In Questions of Exchange there is always a Comparison made between the two Coins, &c. of two Countries

for Kinds) or of more.

3. In Questions where there is a Comparison made between two Things (whether they be Monies, Weights, &c. of different Kinds, there may be a Solution found by a fingle Rule of Three, as by the following Example.

Quest. 1. A Merchant at London deliver'd 370 l. Ster. to receive the same at Paris in French Crowns, the Exchange 3 & French Crowns per l. Sterling, I demand how

many French Crowns he ought to receive?

In placing the Numbers, observe the 6th Rule of the 11th Chapter, which being done, the given Number will fland thus:

1. Crowns 1.

and being reduced according to the Rules of the 12th Chapter, will fland thus:

As \(\frac{1}{4}\) is to \(\frac{1}{3}\), so is \(\frac{27}{1}\) to 1233,

So that I conclude he ought to receive 1233 \(\frac{1}{3}\) French

Crowns at Paris delivered for his 370 L at London.

Quest. 2. A Merchant delivered at Amsterdam 587 l. Flemish, to receive the Value thereof at Naples in Ducats, the

the Exchange 42 Ducats per l. Flemid. I demand how many Ducats he ought to receive?

The Proportion is as followeth:

1. Ducars.

1. Ducars.

As 1 is to 2 to is 1 1 to 2817

So I find he ought to receive 2817. Ducats at Naples

for the 387 1. Flemifb delivered ot Amfterdam.

Quest. 3. A Merchant at Florence delivered 2478 Ducations, to receive the Value at London in Pence, and Exchange at 532 Storl. per Ducatoon; I demand how much Sterling he ought to receive?

The Proportion for Resolution is,

Duc. d. Duc. d.

As \( \frac{1}{2} \) is to \( \frac{1}{2} \) fo ts \( \frac{3}{47} \), to 186073.

which is equal to 775 1. 6s. for the Answer.

4. Where there is a Comparison made between more than two different Coins, Weights, or Measures, there ariseth ordinarily two different Cases from such a Comparison.

r. When it is required to know how many Pieces of the first Coin, Weight, or Measure, are equal in Value to a known Number of Pieces of the last Coin, Weight, or

Meature.

•

-

10

3.

es

e-

c.

n-

er.

w.

he

xh

nob

7%

ats,

2. When it is required to find out how many Pieces of the last Coin, Weight, or Measure, are equal in Value to a given Number of the first Sort of Coin, Wt. or Measure.

## An Example of the first Cafe may be this, viz.

Quest. 4. If 150 Pence at London are equal to 3 Ducats at Napter, and 42 Ducats at Noples make 342 Shillings at Bruffels; then how many Pence at London are equal to 139 a. at Bruffels? Facit 960 d.

The Question may be resolved by two Single Rules of

Three: for first I fay,

If I Ducats at Naples make 150 d. at London, how man

ny Pence will 34 Ducars make ? Auf. 240 d.

By the foregoing Proportion we have discovered that 4. Ducats at Naples make 243 Pence at London; and by the Tenor of the Question we see that 4. Ducats at Venice make 35. Shillings at Braffels, therefore 240 d. at London are equal to 342s. at Braffels (for the Things that are

are equal to one and the same Thing, are also equal to one another) wherefore we have a Way laid open to give a Solution to this Question by another Single Rule of Three whose proportion is,

As 341's at Bruffels is to 240 d. at London, to is 131 s. at Bruffels to 960 d. at London; which is the Answer to

the Question.

An Example of the second Cafe may be this, viz.

Quest. 5. If 40 lb. Averdupois weight at London is equal to 36 lb. weight at Amsterdam, and 90 lb. at Amsterdam, makes 116 lb. at Danzick, then how many Pounds at Danzick, are equal to 122 lb. Averdupois weight at London. Ans. 129\frac{3}{2}^2 at Danzick.

This Question is likewife answered by two fingle Rule of

Three, viz. First, I fay,

As 36 to at Amsterdam is to 461. at London. So is 90 lb. at Amsterd m to 103 lb. at London.

And by the Question you find that 90 lb. at Amsterd m, is 116 lb. at Danzick; and therefore 100 at London is likewise equal thereunto; wherefore again I say,

As 100 lb. at London is to 116 lb. at Danzick. So is 112 lb. at London to 12022 lb. at Danzick.

By which I find that 1292; lb. at Danzick are equal to

112 Averdupois weight at London.

5. There is a more speedy Way to resolve such Questiens as are contained under the two Cases before mention'd
laid down by Mr. Morsey in the third Chapter of his Appendix to Wingate's Arithmetick, where he hath given two
Rules for the Resolution of the Questions pertinent to the
two said Cases.

6. But I shall lay down a general Rule for the Solution of both Cases; and 1st, Let the Learner observe the solution lowing Directions in the placing of the given Terms, viz.

7. Lee these be made two Colums, and in these Colums so place the given Terms one over the other, as that in the same Colum there may not be found two Terms of the same Kind one with the other.

Having thus placed the Terms, the general Rule is,

Observe which of the said Colums hath the most Terms placed in it, and multiply all the Terms theren continually, and place the last Product for a Dividen d

1

f

to

i-

d

n-

NO

he

OR

01-

0-

hat

of

oft

ren en d then then multiply the Terms in the other Column continually, and let the last Product be a Divisor, then divide the said Dividend by the said Divisor, and the Quotient thence arising will be the Answer to the Question.

So the Example of the first of the said Cases being again repeated, viz. If 150 Pence at London make 3 Ducate at Naples make 34 Shillings at Brussels, then how many Pence

The Terms being placed according to the 7th Rule will fland as followerh;

Pence at Lond. 150 3 Ducats at Naples. Ducats at Naples. Shillings. Bruf. 128

Having thus placed the Terms, that in neither Column there is two Terms of one Kind, then observe that the Column under A hath most Terms in it, therefore they must be multiplied togesher for a Dividend, viz. 150 multiplied by 4, produceth 60%, which multiplied by 138, produceth 49680%, for a Dividend then in the Column under B there are 3, and 34%, which multiplied together produce 20%, the Quotient is 960 Pence of the Answer as before.

Again, Lee the Example of the second Case be again repeated, viz. If 40 lb. Averdupois weight at London make 36 lb. Weight at Amsterdam, and 90 lb. at Amsterdam make 116 at Dantzick, then how many pounds at Dantzick are equal to 112 l. Averdupois weight at London.

The Terms being disposed according to the 7th Rule foregoing, will stand thus:

A B

1b. at London

1b. at London

1b. at Amsterdam

90 | 116 | 1b. at Dastnick

112 | 1b. at London.

whereby I find that the Terms under B multiplied together produce 497712 for a Dividend, and the Terms under A. viz. 40 and 90, produce 3600 for a Divisor, and Division being finished, the Quotient giveth 129333 Pounds, Dantzick for the Answer.

## CHAP. XXXI.

# Single Position.

2. Degative Arithmetick, called the Rule of False, is that by which we find out a Truth, by Numbers invested or supposed, either Single or Double.

2. The Rule of Single Position is when at once, viz. by one false Position, or seigned Number, we find out the

true Number fought.

3. In the fingle Rule of Falle, when you have made chice of your Position, work it according to the Tenor of the Question, as if it were the true Number sought; and if by the ordering your Position you find either the Result too much or too little, you may then find at the Number sought by this Proportion sollowing viz.

As the Refult of your Polition is to the Polition, fo is the

given Number to the Number fought.

Example.

Quest. 1. A Person having about 1 im a certain Number of Crowns, said, If a 4th, 3d, and 6th of them were added together, they would make just 45 Crowns, new I demand the Number of Crowns he had about him?

Anf. 60 Crowns.

To refolve this Question, I suppose he had 24 Crowns for any other Number that will admit of the like Division) now the 4th of 24 is 6, and the 3d is 8, and the 6th is 4, all which Parts, (6, 8, and 4) being added sogether, make but 18. but it should be 45, wherefore I say by the Rule of Three.

As 18, the Sum of the Parts is to the Polition 24, to is 45 the given Number, to 60, the True Number fought.

For the 4th of 60 is 13, and the 3d of 60 is 20, and the 6th of 60 is 10, which added together make 45.

#### CHAP. XXXII.

## Double Position.

1. THE Rule of Double Position is when two sales
Positions are assumed to give a Resolution to the
Quettion propounded.

2. When any Question is stated in Double Position, make such a Cross as in the Margin.

3. Then make choice of any Number you think may be convenient for your working, which call your first Position, and Place it at the End of the Cross at a; then Work with this Polition, and it were the true Number fought, according to the Nature of your Quellion; then having found out your Error, either too much or too little, place it at the Side at d, then make choice of another Number of the same Denomination with the first Polition (which call your fecond Polion, and place it on the Side of the Crofs at b; then work with this Pufition as with the former, and having found out your Error. either too much or too little, place it on that Side of the Crofs at c; and then the Polition will stand at the Top of the Crofs, and the Errors at the Bottom, each under his Correspondent Position, and then multiply the Errors into the Polition crofs-wife, that is, multiply the fielt Polition by the fecond Error, and the fecond Polition by the first Error.

4. Having proceeded to far, then confider whether the Errors are both alike; and if they are alike; then sub-firact the lesser Product from the greater, and set the Remainder for a Dividend; then substruct the lesser Error from the greater, and let the Remainder be a Divisor, and the Quotient arising by this Division is the Answer to the

and put each Product over its Polition.

Question.

5. But if the Errors are unlike, that is one too much and the other too little, then add the Products of the Pofirions and Errors together, and their Sums shall be a Dividend, then add the Errors together, and their Sum shall

# CHAP. XXXI.

# Single Position.

that by which we find out a Truth, by Numbers in-

2. The Rule of Single Position is when at once, viz. by one false Position, or seigned Number, we find out the

true Number fought.

3. In the fingle Rule of Falle, when you have made ch ice of your Position, work it according to the Tenor of the Question, as it it were the true Number sought; and if by the ordering your Position you find either the Result too much or too little, you may then find ut the Number sought by this Proportion following viz.

As the Refult of your Polition is to the Polition, lo is the

given Number to the Number fought.

Example.

Quest. r. A Person having about I im a certain Number of Crowns, said, If a 4th, 3d, and 6th of them were added together, they would make just 45 Crowns, now I demand the Number of Crowns he had about him?

Anf. 60 Crowns.

To refolve this Question, I suppose he had 24 Crowns (or any other Number that will admit of the like Division) now the 4th of 24 is 6, and the 3d is 8, and the 6th is 4, all which Parts, (6, 8, and 4) being added together, make but 18. but it should be 45, wherefore I say by the Rule of Three.

As 18, the Sum of the Parts is to the Polition 24, to is 45 the given Number, to 60, the True Number fought.

For the 4th of 60 is 15, and the 3d of 60 is 20, and the 6th of 60 is 10, which added together make 45.

# CHAP. XXXII.

# Double Position.

1. THE Rule of Double Position is when two salfe Positions are assumed to give a Resolution to the Quettion propounded.

2. When any Question is stated in Double Position, make such a Cross as in the Margin.

aX.

3. Then make choice of any Number you think may be convenient for your working, which call your first Position, and Place it at the End of the Cross at a; then Work with this Polition, and it were the true Number fought, according to the Nature of your Question; then having found out your Error, either too much or too little, place it at the Side at d, then make choice of another Number of the fame Denomination with the first Polition (which call your fecond Polion, and place it on the Side of the Crofs at &; then work with this Pufition as with the former, and having found out your Error. either too much or too little, place it on that Side of the Crofs at c; and then the Position will stand at the Top of the Crofs, and the Errors at the Bottom, each under his Correspondent Position, and then multiply the Errors into the Position cross-wife, that is, multiply the fiest Position by the fecond Error, and the fecond Polition by the first Error. and put each Product over its Position.

4. Having proceeded fo far, then confider whether the Errors are both alike; and if they are alike; then sub-stract the lesser Product from the greater, and set the Remainder for a Dividend; then substract the lesser Error from the greater, and let the Remainder be a Divisor, and the Quotient arising by this Division is the Answer to the

Question.

5. But if the Errors are unlike, that is one too much and the other too little, then add the Products of the Pofitions and Errors together, and their Sums shall be a Dividend, then add the Errors together, and their Sum shall

De a Divisor, and the Quotient arising hence is the Answer. Quest. 1. A B, and C built a House, which cost 76 l. of which A paid a certain Sum unknown, B paid as much as A, and 10 l. over, and C as much as A and B: Now I desire to

know each Man's Share in that Charge?

Having made a Cross according to the second Rule, I come according to the third Rule to make choice of my first position, and here I suppose A paid 6 t. which I put upon the Cross as you see, then B paid 16 t. (for its said he paid 10 t. more than A) and C paid 22 t. (for its said he paid as much as A and B) then I add their Parts.

1		1.
1. 9 10 28		A 6
19		B 16
28	120 168 288	C 22
—	6 79	
56	a) X 9 (14 20	Sum 44
	32 2 20	
76	12	76
76 56 20	A CONTRACTOR OF THE SECOND	44
		nter hand and
20		Erior 32

And they amount to 44, but it is said they paid 76%. wherefore there is 32 too little, which I note down at the Bottom of the Cross under its Position for the first Error.

2dly, I suppose A paid 9 1. then B paid 19 1. and C 28 1. all which add together make 56, but they should make 76, wherefore the Error of this position is 20, which I put at the Bottom of the Crois under its position for the 2d Error; then I multiply the Errors and position Cross wise, viz. 32 (the Error of the sirft position) by 9 (the 2d position) and the product is 288. Then I multiply 20 (the Error of the 2d position) by 6 (the first position) and the product is 120.

Then according to the 4th Rule) I substract the lesser product from the greater, viz. 120 from 288, because the Errors are both alike, viz. too little, and there remain-

maineth 168 for a Dividend; then subctract 22 (the leffer Error) from 32, the greater Error, and the Remainder is 12, for a Divisor; then I divide 168 by 12, and the Quotient is 14 for the Answer, which is the Share of

A in the payment.

6. Again, 2dly, If the Errors had been both too big it, had had the tame Effect, as appeareth by the following Work; for first, I suppose A paid 20 l. then B paid 30 l. and C 50 l. which in all is 100 l. but it should have been no more than 76, wherefore the first Error is 24 too much. Again, I suppose A paid 18 l. then B must pay 28 l. and C must pay 46 l. which in all is 92 l. but it should have been but 76.

76	Substr. 24 16	Substr. 76
100 Sum	8) X (14	Sum 92
50 C	320 112 432	C 28
30 B		B 28
20 A		A 18

wherefore the second Error is 16 too much; then I multiply 20 (the first Position) by 16 (the 2d Error) and the Product is 320; again, I multiply 18 (the 2d position) by 24. (the first Error) and the product is 432. Then because the Errors are both too much, I substract 320 (the lesser product) from 432 (the greater product) and there remaineth 112 for a Dividend; likewise I substract 16 (the lesser Error) from 24 (the greater Error) and the Difference is 8 for a Divisor; then perform Division, and the Quotient is 14, as before for the Answer.

Again, 3dly, If the Errors had been the one too big, and the other too little, Respect being had to the 5th Rule foregoing, the Answer would have been the same; as thus, I take for my first position 6, and then the Error is 22 too

little; then I take for my tecond position 18, and then the Error is 16 too much; then I multiply the positions and Errors cross wife, and the product are 96 and 576, and because the Errors are unlike, wix one too big, and another too little, I add the Product 25 and 576 toge-

96 672 576 6 16 48) 32 (34 16 ther, and their Sum is 672 for a Dividend; I likewise add the Errors 32 and 16 together, and their Sum is 48 for a Divisor; then having finished Division, I find the Quotient to be 14, which is the Answer, as was found out at the two several Trials before.

For the Proof of the Work I fay,

If A paid

Then B paid 14 and 10 (that is)

24

Then C paid 14 and 24 (that is)

38

The Sum of all his \_\_\_\_\_\_76

which is the total Value of the Building, and equal to the

given Number.

Those who desire to see the Demonstration of this Rule let them read the 7th Chapter of Mr. Kersey's Appendix to Mr. Wingate's Arithmetick, Petiseus in the 5th Book of his Trigonometria, or Mr. Oughtred in his Clavis Mathematica.

Quest. 2. Three Persons, A, B, and C, discoursed together concerning their Age; quoth A, I am 18 Years of Age; quoth B, I am as old as A and half C; and quoth C, I am as old as you both, if your Years were added together. Now I desire to know the Age of each Person?

A.f. A is 18, B is 54, and C is 72 Years of Age.

Quest. 3. A Father lying at the Point of Death, left to his Three Sons, viz. A, B, and C, all his Estate in Money, and divided it as followeth, viz. to A he gave half wanting 44 l. to B, he gave 4 and 24 l. over, and to C he gave the Remainder, which was 38 l. lefs than the Share of B; now I demand what was the Sum left, and each Man's Part?

Anf. The Sum bequeathed was 588 1. wherefore A had

2501. B had 210 1. and C had 128 1.

Queft. 4. Two Persons, viz. A and B had each in their Hands a certain Number of Crowns, and A said to B, If you give me one of your Crowns, I shall have sive times as many as you; and said B to him again, If you give

give me one of yours, then we shall each of as make an equal Number; now I demand how many Crowns had each Person?

Anf. A had 4 and be had 2 Crowns.

Quest. 5. What Number is thet ento which if I add 1—4th of itself, and from the Sum substract 1—8th of it self, the Remainder will be 216?

Anf. 192.

Many more Questions may be added, but these well understood, will be sufficient, seven for the meanest Capacity) for the Resolution of any other Question pertinent to this Rule.

There may be an Objection made, because we have not treated particularly upon Interest and Rebate; but the Operation of such Questions being more applicable to Decimals, are omitted, till we come to acquain the Learner therewith.

#### FINIS.

Just published, beautifully printed in Quarto, on a fine Genoa Demy Paper.

HE Gentleman's and Builder's Repository; or, Architecture display'd. Containing the most Useful Problems in Geometry. As all, The most easy, Expeditious, and correct Methods for attaining the Knowledge of the five Orders of Architecture, by equal Parts, and fewer Divisions, than any Thing hitherto published, Together with all fuch Rules for Arches, Doors, Windows, Ceiling Pieces, Chimney-Pieces, and their particular Embellichments os can be required. Likewife, a large Variety of Defigns for Trufs Roofs; with the Method of finding the Hip, either Square or Bevel. Alfo, The most certain and approved Methods for forming a Number of deficient Stair-cases, with their Twisted Rails, &c. The Whole embellish'd, not only with fourfcore Plates, in Quarto, but such Variety of Cieling Pieces, Shields, Compartments, and other curious and uncommon Deorations as must needs render it acceptable to all Gentlemen, Artificers, and others, who delight in, or practife the Art of The Defigns regulated and drawn by E.
